Novel selective inhibitors of viral or bacterial neuraminidases

10

Background of the Invention

Field of the Invention

Neuraminidase (also known as sialidase, acylneuraminyil hydrolase, 15 and EC 3.2.1.18) is an enzyme common among animals and a number of microorganisms. It is a glycohydrolase that cleaves terminal alpha-ketosidically linked sialic acids from glycoproteins, glycolipids and oligosaccharides. Many of the microorganisms containing neuraminidase are pathogenic to man and other animals including fowl, horses, swine and seals. These pathogenic organisms include influenza virus.

Neuraminidase has been implicated in the pathogenicity of influenza viruses. It is thought to help the elution of newly synthesized viroids from infected cells and assist in the movement of the virus (through its hydrolase activity) through the mucus of the respiratory tract.

Brief Description of Related Art

Itzstein, M. von et al.; "Nature", 363(6428):418-423 (1993), discloses the rational design of sialidase-based inhibitors of influenza virus replication. Colman, P. M. et al.; International Patent Publication No. WO 92/06691 (Int. App. No. PCT/AU90/00501, publication date April 30, 1992), Itzstein, L. M. von et al.; European Patent Publication No. 0 539 204 A1 (EP App. No. 92309684.6, publication date April 28, 1993), and Itzstein, L. M. von et al.; International Publication No. WO 91/16320 (Int. App. No. PCT/AU91/00161, publication date October 31, 1991) disclose compounds that bind neuraminidase and are asserted to exhibited antiviral activity *in vivo*.

Objects of the Invention

A principal object of the invention is inhibition of viruses, in particular influenza viruses. In particular, an object is inhibition of glycolytic enzymes such as neuraminidase, in particular the selective inhibition of viral or bacterial neuraminidases.

An additional object of the invention is to provide neuraminidase inhibitors that have a retarded rate of urinary excretion, that enter into nasal or pulmonary secretions from the systemic circulation, that have sufficient oral bioavailability to be therapeutically effective, that possess elevated potency, that exhibit clinically acceptable toxicity profiles and have other desirable pharmacologic properties.

Another object is to provide improved and less costly methods for synthesis of neuraminidase inhibitors.

A still further object is to provide improved methods for administration of known and novel neuraminidase inhibitors.

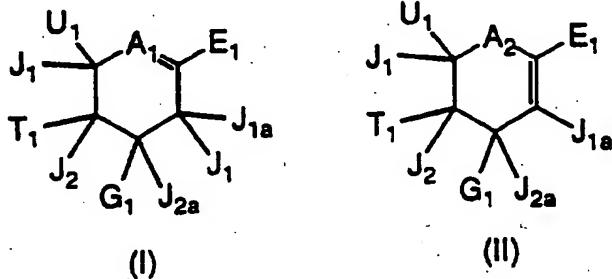

An additional object is to provide compositions useful in preparing polymers, surfactants or immunogens and for use in other industrial processes and articles.

These and other objects will be readily apparent to the ordinary artisan from consideration of the invention as a whole.

30 Detailed Description

#### Compositions of the Invention.

The compounds of this invention exclude compounds heretofore known. However, as will be further apparent below in other embodiments it is within the invention to use for antiviral purposes known compounds

heretofore only produced and used as intermediates in the preparation of antiviral compounds. With respect to the United States, the compounds or compositions herein exclude compounds that are anticipated under 35 USC §102 or obvious under 35 USC §103. In particular, the claims herein shall be  
5 construed as excluding the compounds which are anticipated by or not possessing novelty over WO 91/16320, WO 92/06691, US patent 5,360,817 or Chandler, M.; et al.; J. Chem. Soc. Perkin Trans. 1 1995, 1189-1197.

The foregoing notwithstanding, in an embodiment of the invention one identifies compounds that may fall within the generic scope of WO 10 91/16320, WO 92/06691, or US patent 5,360,817 but which have (a) formula Ia of the '320 application, (b) carbon for group "A" in the '320 application, and (c) R<sup>5</sup> of the '320 and '691 applications being "-CH<sub>2</sub>YR<sup>6</sup>, -CHYR<sup>6</sup>CH<sub>2</sub>YR<sup>6</sup> or -CHYR<sup>6</sup>CHYR<sup>6</sup>CH<sub>2</sub>YR<sup>6</sup>" where YR<sup>6</sup> cannot be either OH or protected OH in which the protecting group is capable of hydrolysis to yield the free OH under 15 conditions of the human gastrointestinal tract, i.e. the compounds are stable to hydrolysis in the gastrointestinal tract. Thus, typically excluded from this embodiment are compounds of the '320 or '691 applications where R<sup>5</sup> therein is acetyl or other carbacyl having 1-4 carbon atoms.

Recipes and methods for determining stability of compounds in 20 surrogate gastrointestinal secretions are known. Compounds are defined herein as stable in the gastrointestinal tract where less than about 50 mole percent of the protected groups are deprotected in surrogate intestinal or gastric juice upon incubation for 1 hour at 37°C. Such compounds are suitable for use in this embodiment. Note that simply because the compounds are 25 stable to the gastrointestinal tract does not mean that they cannot be hydrolyzed in vivo. Prodrugs typically will be stable in the digestive system but are substantially hydrolyzed to the parental drug in the digestive lumen, liver or other metabolic organ, or within cells in general.

It should be understood, however, that other embodiments of this 30 invention more fully described below contemplate the use of compounds that are in fact specifically disclosed in WO 91/16320, WO 92/06691, or US patent 5,360,817, including those in which YR<sup>6</sup> is free hydroxyl, or hydroxyl protected by a readily hydrolyzable group such as acetyl. In this instance, however, the compounds are delivered by novel routes of administration.

35 In another embodiment, the compounds herein exclude those in which  
(a) E<sub>1</sub> is -CO<sub>2</sub>H, -P(O)(OH)<sub>2</sub>, -NO<sub>2</sub>, -SO<sub>2</sub>H, -SO<sub>3</sub>H, tetrazolyl, -CH<sub>2</sub>CHO,

-CHO, or -CH(CHO)2;

(b) G1 is -CN, N3,-NHR20, NR20, -OR20, guanidino, SR20, -N(R20) $\rightarrow$ O, -N(R20)(OR20), -N(H)(R20)N(R20)2, unsubstituted pyrimidinyl, or unsubstituted (pyrimidinyl)methyl;

5 (c) T<sub>1</sub> is -NHR<sub>20</sub>, -NO<sub>2</sub>; and R<sub>20</sub> is H; an acyl group having 1 to 4 carbon atoms; a linear or cyclic alkyl group having 1 to 6 carbon atoms, or a halogen-substituted analogue thereof; an allyl group or an unsubstituted aryl group or an aryl substituted by a halogen, an OH group, an NO<sub>2</sub> group, an NH<sub>2</sub> group or a COOH group;

10 (d) each  $J_1$  is  $H$ ; and

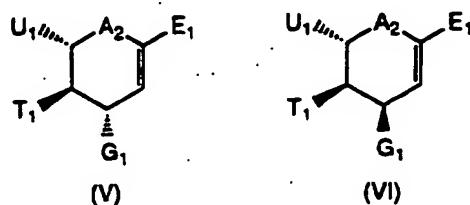

(e)  $X_1$  is a bond,  $-CH_2-$  or  $-CH_2CH_2-$ ; in which case  $W_6$  is not H,  $W_7$  or  $-CH_2W_7$  wherein  $W_7$  is H,  $-OR_{6a}$ ,  $-OR_1$ ,  $-N(R_1)_2$ ,  $-N(R_1)(R_{6b})$ ,  $-N(R_{6b})_2$ ,  $-SR_1$ , or  $-SR_{6a}$ .

In a further embodiment, the compounds of this invention are those  
15 in which U<sub>1</sub> is not -CH<sub>2</sub>OH, -CH<sub>2</sub>OAc, or -CH<sub>2</sub>OCH<sub>2</sub>Ph.

In a further embodiment, the compounds of this invention are those in which E<sub>1</sub> is not -CH<sub>2</sub>OH, -CH<sub>2</sub>OTMS, or -CHO.

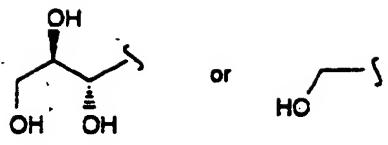

In a further embodiment, the compounds of this invention are those in which U<sub>1</sub> is not bonded directly to the nuclear ring by a carbon atom or U<sub>1</sub> is not substituted with hydroxyl or hydroxyester, in particular U<sub>1</sub> is not polyhydroxyalkane, especially -CH(OH)CH(OH)CH<sub>2</sub>OH. In a further embodiment, U<sub>1</sub> is a branched chain group R<sub>5</sub> as described below or a carbocycle which is substituted with at least one group R<sub>5</sub>.

In a further embodiment, excluded from the invention are

The general principles of acidity and basicity of organic materials are well understood and are to be understood as defining W<sub>1</sub>. They will not be

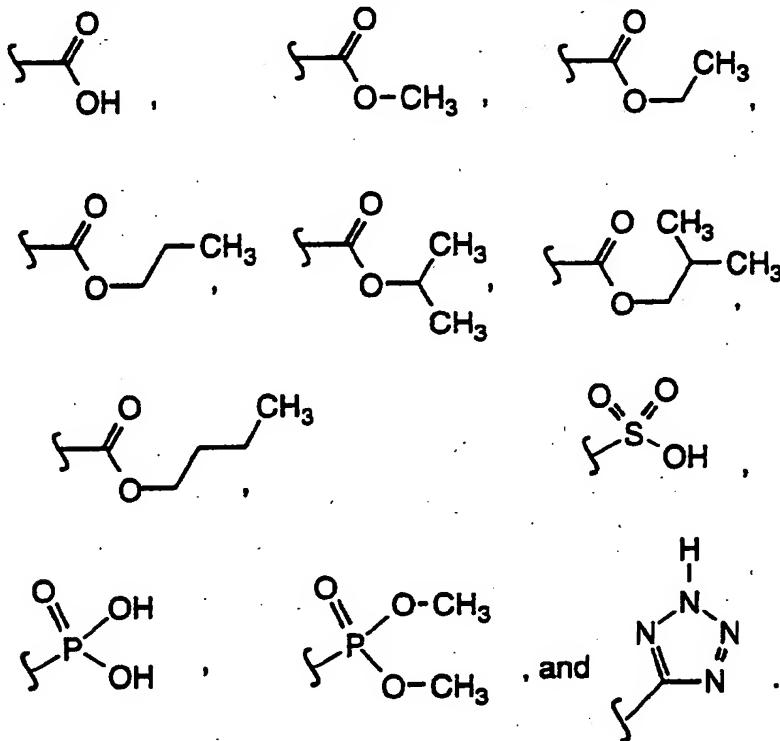

25 detailed here. However, a description appears in Streitwieser, A.; and Heathcock, C. H.; "Introduction to Organic Chemistry, Second Edition" (Macmillan, New York, 1981), pages 60-64. Generally, acidic groups of the invention have pK values less than that of water, usually less than pK = 10, typically less than pK = 8, and frequently less than pK = 6. They include

30 tetrazoles and the acids of carbon, sulfur, phosphorous and nitrogen, typically the carboxylic, sulfuric, sulfonic, sulfonic, phosphoric and phosphonic acids, together with the R<sub>6c</sub> amides and R<sub>6b</sub> esters of those acids (R<sub>6a</sub> and R<sub>6c</sub> are defined below). Exemplary W<sub>1</sub> are -CO<sub>2</sub>H, -CO<sub>2</sub>R<sub>6a</sub>, -OSO<sub>3</sub>H, -SO<sub>3</sub>H, -SO<sub>2</sub>H,

 protected by one of the groups commonly used in the art for such groups and

W<sub>2</sub> is a group comprising a basic heteroatom, a protected basic  
 heteroatom or an R<sub>6b</sub> amide of the basic heteroatom. W<sub>2</sub> generally comprises  
 a basic heteroatom, which, within the context of the invention means an  
 atom other than carbon which is capable of protonation, typically by an acidic  
 20 hydrogen having an acidity in the range described above for W<sub>1</sub>. The basic  
 principles of basicity are described in Streitwieser and Heathcock (*op. cit.*) and  
 provide meaning for the term basic heteroatom as will be understood by those

ordinarily skilled in the art. Generally, the basic heteroatoms employed in the compounds of the invention have pK values for the corresponding protonated form that are in the range of values described above for W<sub>1</sub>. Basic heteroatoms include the heteroatoms common in organic compounds which

5 have an un-shared, non-bonding, n-type, or the like, electron pair. By way of example and not limitation, typical basic heteroatoms include the oxygen, nitrogen, and sulfur atoms of groups such as alcohols, amines, amidines, guanidines, sulfides, and the like, frequently, amines, amidines and guanidines. Ordinarily, W<sub>2</sub> is amino or an amino alkyl (generally lower

10 alkyl) group such as aminomethyl, aminoethyl or aminopropyl; an amidinyl, or an amidinoalkyl group such as amidinomethyl, amidinoethyl, or amidinopropyl; or guanidinyl, or a guanidinoalkyl group such as guanidinomethyl, guanidinoethyl, or guanidinopropyl (in each instance wherein the alkyl group serves to bridge the basic substituent to the

15 carbocyclic ring). More typically, W<sub>2</sub> is amino, amidino, guanidino, heterocycle, heterocycle substituted with 1 or 2 amino or guanidino groups (usually 1), or an alkyl of 2 to 3 carbon atoms substituted with amino or guanidino, or such alkyl substituted with an amino and a second group selected from the group consisting of hydroxy and amino. The heterocycles

20 useful as W<sub>2</sub> include typically N or S-containing 5 or 6 membered rings, wherein the ring contains 1 or 2 heteroatoms. Such heterocycles generally are substituted at ring carbon atoms. They may be saturated or unsaturated and may be linked to the core cyclohexene by lower alkyl (m1=1 or 2) or by -NR<sub>1</sub>-.

Still more typically, W<sub>2</sub> is -NHR<sub>1</sub>, -C(NH)(NH<sub>2</sub>), -NR<sub>1</sub>-C(NR<sub>1</sub>)(NR<sub>1</sub>R<sub>3</sub>),

25 -NH-C(NH)(NHR<sub>3</sub>), -NH-C(NH)(NHR<sub>1</sub>), -NH-C(NH)NH<sub>2</sub>, -CH(CH<sub>2</sub>NHR<sub>1</sub>)(CH<sub>2</sub>OH), -CH(CH<sub>2</sub>NHR<sub>1</sub>)(CH<sub>2</sub>NHR<sub>1</sub>), -CH(NHR<sub>1</sub>)-(CR<sub>1</sub>R<sub>1</sub>)<sub>m2</sub>-CH(NHR<sub>1</sub>)R<sub>1</sub>, -CH(OH)-(CR<sub>1</sub>R<sub>1</sub>)<sub>m2</sub>-CH(NHR<sub>1</sub>)R<sub>1</sub>, or

30 -N=C(NHR<sub>1</sub>)(R<sub>1</sub>); wherein each m2 is ordinarily 0, and ordinarily R<sub>1</sub> is H and R<sub>3</sub> is C(O)N(R<sub>1</sub>)<sub>2</sub>.

W<sub>2</sub> optionally is a protected basic heteroatom which within the context of the invention means a basic heteroatom as described above that has been protected by R<sub>6b</sub> such as one of the groups common in the art. Such groups are described in detail in Greene (*op. cit.*) as set forth below. Such groups include by way of example and not limitation, amides, carbamates, amino acetics, imines, enamines, N-alkyl or N-aryl phosphinyls, N-alkyl or N-aryl

sulfenyls or sulfonyls, N-alkyl or N-aryl silyls, thioethers, thioesters, disulfides, sulfenyls, and the like. In some embodiments, the protecting group R<sub>6b</sub> will be cleavable under physiological conditions, typically it will be cleavable *in vivo* where, for example, the basic heteroatom forms an amide with an organic acid or an amino acid such as a naturally occurring amino acid or a polypeptide as described below for the R<sub>6a</sub> group.

As defined above for R<sub>4</sub>, R<sub>5a</sub>'s are of 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, or 12 carbon atoms when alkylene and of 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, or 12 carbon atoms when alkenylene or alkynylene. Each of the typical R<sub>4</sub> groups is a typicall R<sub>5a</sub> group with the proviso that one of the hysrogen atoms of the described R<sub>4</sub> group is removed to form the open valence to a carbon atom through which the second bond to the R<sub>5a</sub> is attached.

R<sub>10</sub> is alkyl, alkenyl, alkynyl of 1 to 12 carbon atoms substituted with 0 to 3 R<sub>2</sub>.

R<sub>11</sub> is independently H or R<sub>10</sub>.

- 20 R<sub>12</sub> is a cycloalkyl of 3 to 10 carbon atoms, or cycloalkenyl of 4 to 10 carbon atoms.

R<sub>14</sub> is normal or terminally secondary C<sub>1</sub>-C<sub>6</sub> alkyl.

- W<sub>5</sub> is a carbocycle or heterocycle, with the proviso that each W<sub>5</sub> is independently substituted with 0 to 3 R<sub>2</sub> groups. W<sub>5</sub> carbocycles and T<sub>1</sub> and W<sub>5</sub> heterocycles are stable chemical structures. Such structures are isolatable in measurable yield, with measurable purity, from reaction mixtures at temperatures from -78°C to 200°C. Each W<sub>5</sub> is independently substituted with 0 to 3 R<sub>2</sub> groups. Typically, T<sub>1</sub> and W<sub>5</sub> are a saturated, unsaturated or aromatic ring comprising a mono- or bicyclic carbocycle or heterocycle. More typically, T<sub>1</sub> or W<sub>5</sub> has 3 to 10 ring atoms, still more typically, 3 to 7 ring atoms, and ordinarily 3 to 6 ring atoms. The T<sub>1</sub> and W<sub>5</sub> rings are saturated when containing 3 ring atoms, saturated or monounsaturated when containing 4 ring atoms, saturated, or mono- or diunsaturated when containing 5 ring atoms, and saturated, mono- or diunsaturated, or aromatic when containing 6 ring atoms.

When W<sub>5</sub> is carbocyclic, it is typically a 3 to 7 carbon monocycle or a 7 to 12 carbon atom bicycle. More typically, W<sub>5</sub> monocyclic carbocycles have 3

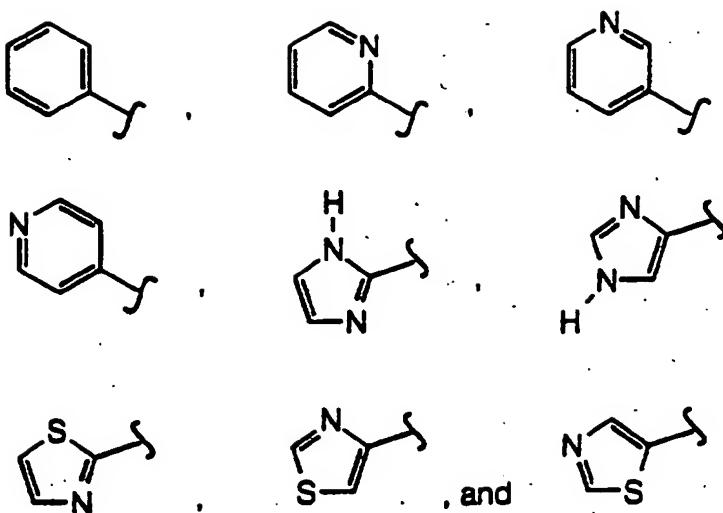

to 6 ring atoms, still more typically 5 or 6 ring atoms. W5 bicyclic carbocycles have 7 to 12 ring atoms arranged as a bicyclo [4,5], [5,5], [5,6] or [6,6] system, still more typically, 9 or 10 ring atoms arranged as a bicyclo [5,6] or [6,6] system. Examples include cyclopropyl, cyclobutyl, cyclopentyl, 1-cyclopent-1-enyl, 1-cyclopent-2-enyl, 1-cyclopent-3-enyl, cyclohexyl, 1-cyclohex-1-enyl, 1-cyclohex-2-enyl, 1-cyclohex-3-enyl, phenyl, spiryl and naphthyl.

A T<sub>1</sub> or W<sub>5</sub> heterocycle is typically a monocyte having 3 to 7 ring members (2 to 6 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S) or a bicycle having 7 to 10 ring members (4 to 9 carbon atoms and 1 to 3 heteroatoms selected from N, O, P, and S). More typically, T<sub>1</sub> and W<sub>5</sub> heterocyclic monocycles have 3 to 6 ring atoms (2 to 5 carbon atoms and 1 to 2 heteroatoms selected from N, O, and S), still more typically, 5 or 6 ring atoms (3 to 5 carbon atoms and 1 to 2 heteroatoms selected from N and S). T<sub>1</sub> and W<sub>5</sub> heterocyclic bicycles have 7 to 10 ring atoms (6 to 9 carbon atoms and 1 to 2 heteroatoms selected from N, O, and S) arranged as a bicyclo [4,5], [5,5], [5,6], or [6,6] system, still more typically, 9 to 10 ring atoms (8 to 9 carbon atoms and 1 to 2 hetero atoms selected from N and S) arranged as a bicyclo [5,6] or [6,6] system.

Typically T<sub>1</sub> and W<sub>5</sub> heterocycles are selected from pyridyl, pyridazinyl, pyrimidinyl, pyrazinyl, s-triazinyl, oxazolyl, imidazolyl, thiazolyl, isoxazolyl, pyrazolyl, isothiazolyl, furanyl, thifuranyl, thienyl, or pyrrolyl.

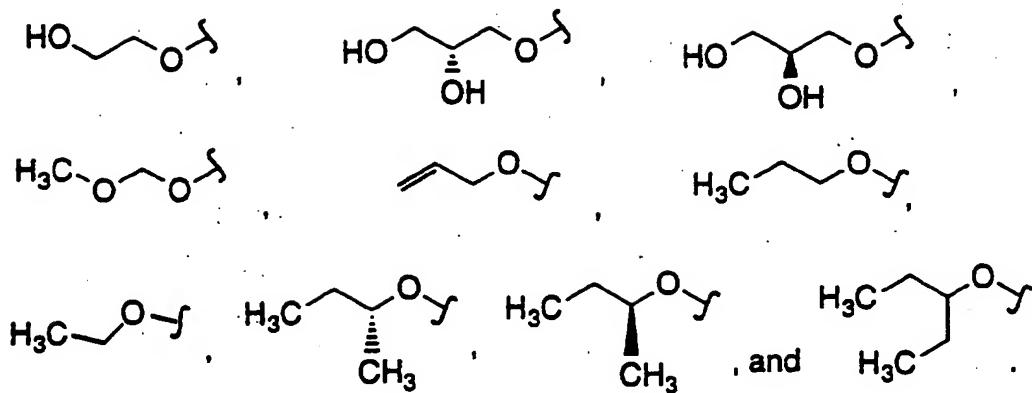

More typically, the heterocycle of T<sub>1</sub> and W<sub>5</sub> is bonded through a carbon atom or nitrogen atom thereof. Still more typically T<sub>1</sub> heterocycles are bonded by a stable covalent bond through a nitrogen atom thereof to the cyclohexene ring of the compositions of the invention and W<sub>5</sub> heterocycles are bonded by a stable covalent bond through a carbon or nitrogen atom thereof to the cyclohexene ring of the compositions of the invention. Stable covalent bonds are chemically stable structures as described above.

W<sub>5</sub> optionally is selected from the group consisting of:

In some embodiments, W<sub>6</sub> is -CHR<sub>1</sub>W<sub>7</sub> or 10     -C(O)W<sub>7</sub>, or W<sub>6</sub> is -(CH<sub>2</sub>)<sub>m1</sub>CH((CH<sub>2</sub>)<sub>m3</sub>R<sub>3</sub>)<sub>2</sub>, -(CH<sub>2</sub>)<sub>m1</sub>C((CH<sub>2</sub>)<sub>m3</sub>R<sub>3</sub>)<sub>3</sub>; -(CH<sub>2</sub>)<sub>m1</sub>CH((CH<sub>2</sub>)<sub>m3</sub>R<sub>5a</sub>W<sub>5</sub>)<sub>2</sub>; -(CH<sub>2</sub>)<sub>m1</sub>CH((CH<sub>2</sub>)<sub>m3</sub>R<sub>3</sub>)((CH<sub>2</sub>)<sub>m3</sub>R<sub>5a</sub>W<sub>5</sub>); -(CH<sub>2</sub>)<sub>m1</sub>C((CH<sub>2</sub>)<sub>m3</sub>R<sub>3</sub>)<sub>2</sub>(CH<sub>2</sub>)<sub>m3</sub>R<sub>5a</sub>W<sub>5</sub>), (CH<sub>2</sub>)<sub>m1</sub>C((CH<sub>2</sub>)<sub>m3</sub>R<sub>5a</sub>W<sub>5</sub>)<sub>3</sub> or -(CH<sub>2</sub>)<sub>m1</sub>C((CH<sub>2</sub>)<sub>m3</sub>R<sub>3</sub>)((CH<sub>2</sub>)<sub>m3</sub>R<sub>5a</sub>W<sub>5</sub>)<sub>2</sub>; and wherein m<sub>3</sub> is an integer 15     from 1 to 3.

More typically, W<sub>7</sub> is -OR<sub>1</sub> or an alkyl of 3 to 12 carbon atoms substituted with OR<sub>1</sub>.
- 20      In general, U<sub>1</sub> is R<sub>1</sub>O-, -OCH<sub>1</sub>W<sub>7</sub>,

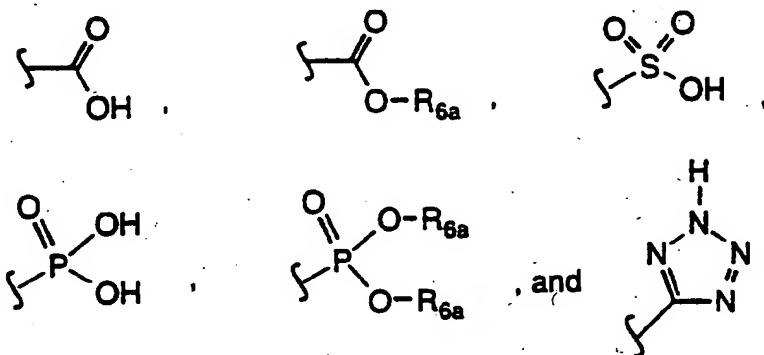

Exemplary U<sub>1</sub> groups are listed in Table 2.

An embodiment of the invention comprises a compound of the  
5 formula:

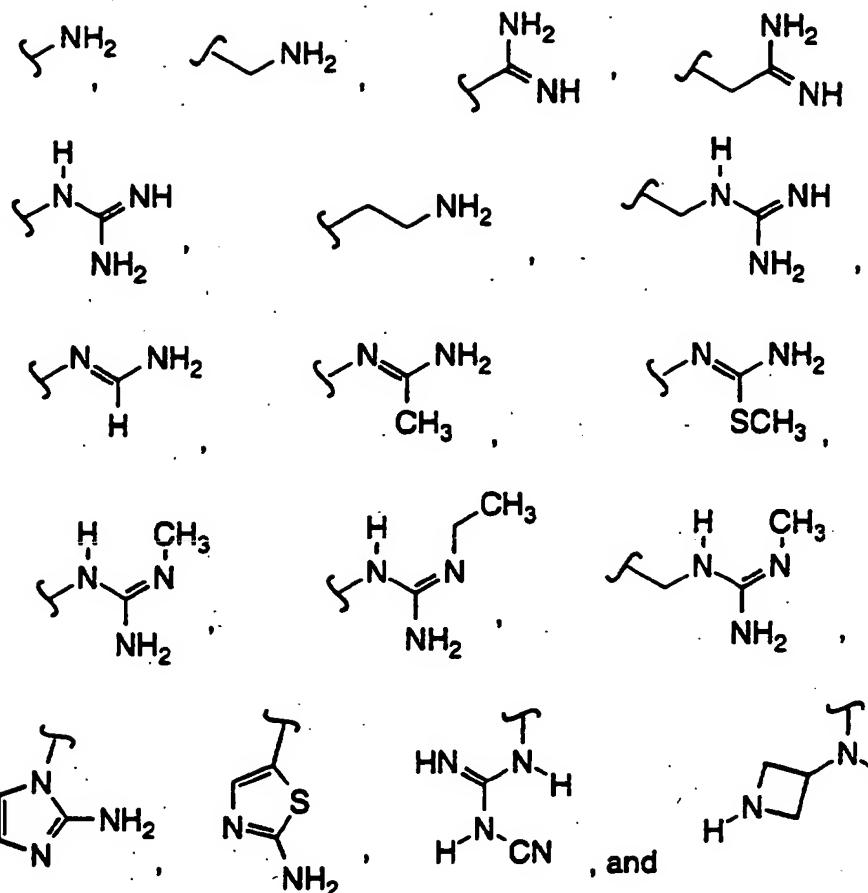

wherein E<sub>2</sub> is E<sub>1</sub>, but is typically selected from the group consisting of:

10

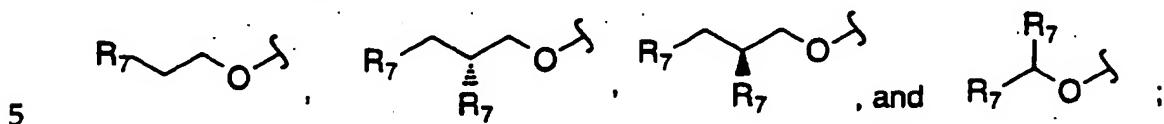

and wherein G<sub>2</sub> is G<sub>1</sub>, but is typically selected from the group consisting of:

and wherein T<sub>2</sub> is R<sub>4</sub> or R<sub>5</sub>. Generally, T<sub>2</sub> is alkyl of 1 to 2 carbon atoms substituted with 0 to 3 fluorine atoms.

$U_2$  is one of:

Groups R<sub>6a</sub> and R<sub>6b</sub> are not critical functionalities and may vary widely.  
When not H, their function is to serve as intermediates for the parental drug substance. This does not mean that they are biologically inactive. On the contrary, a principal function of these groups is to convert the parental drug into a prodrug, whereby the parental drug is released upon conversion of the prodrug *in vivo*. Because active prodrugs are absorbed more effectively than the parental drug they in fact often possess greater potency *in vivo* than the parental drug. R<sub>6a</sub> and R<sub>6b</sub> are removed either *in vitro*, in the instance of chemical intermediates, or *in vivo*, in the case of prodrugs. With chemical

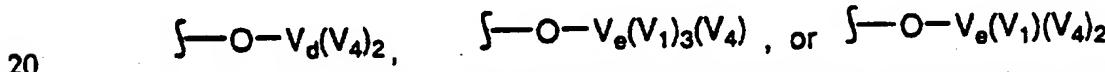

intermediates, it is not particularly important that the resulting pro-functionality products, e.g. alcohols, be physiologically acceptable, although in general it is more desirable if the products are pharmacologically innocuous.

- R<sub>6a</sub> is H or an ether- or ester-forming group. "Ether-forming group" means a group which is capable of forming a stable, covalent bond between the parental molecule and a group having the formula:

- Wherein V<sub>a</sub> is a tetravalent atom typically selected from C and Si; V<sub>b</sub> is a trivalent atom typically selected from B, Al, N, and P, more typically N and P; V<sub>c</sub> is a divalent atom typically selected from O, S, and Se, more typically S; V<sub>1</sub> is a group bonded to V<sub>a</sub>, V<sub>b</sub> or V<sub>c</sub> by a stable, single covalent bond, typically V<sub>1</sub> is W<sub>6</sub> groups, more typically V<sub>1</sub> is H, R<sub>2</sub>, W<sub>5</sub>, or -R<sub>5a</sub>W<sub>5</sub>, still more typically H or R<sub>2</sub>; V<sub>2</sub> is a group bonded to V<sub>a</sub> or V<sub>b</sub> by a stable, double covalent bond, provided that V<sub>2</sub> is not =O, =S or =N-, typically V<sub>2</sub> is =C(V<sub>1</sub>)<sub>2</sub> wherein V<sub>1</sub> is as described above; and V<sub>3</sub> is a group bonded to V<sub>a</sub> by a stable, triple covalent bond, typically V<sub>3</sub> is =C(V<sub>1</sub>) wherein V<sub>1</sub> is as described above.

"Ester-forming group" means a group which is capable of forming a stable, covalent bond between the parental molecule and a group having the formula:

- Wherein V<sub>a</sub>, V<sub>b</sub>, and V<sub>1</sub>, are as described above; V<sub>d</sub> is a pentavalent atom typically selected from P and N; V<sub>e</sub> is a hexavalent atom typically S; and V<sub>4</sub> is a group bonded to V<sub>a</sub>, V<sub>b</sub>, V<sub>d</sub> or V<sub>e</sub> by a stable, double covalent bond, provided that at least one V<sub>4</sub> is =O, =S or =N-V<sub>1</sub>, typically V<sub>4</sub>, when other than =O, =S or =N-, is =C(V<sub>1</sub>)<sub>2</sub> wherein V<sub>1</sub> is as described above.

Protecting groups for -OH functions (whether hydroxy, acid or other functions) are embodiments of "ether- or ester-forming groups":

- Particularly of interest are ether- or ester-forming groups that are capable of functioning as protecting groups in the synthetic schemes set forth herein. However, some hydroxyl and thio protecting groups are neither

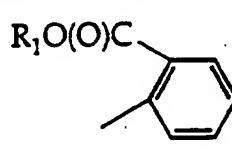

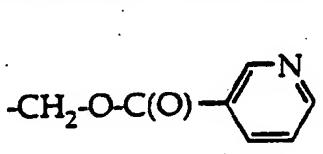

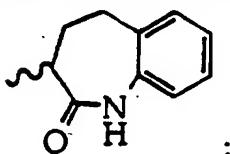

ether- nor ester-forming groups, as will be understood by those skilled in the art, and are included with amides, discussed under R<sub>6c</sub> below. R<sub>6c</sub> is capable of protecting hydroxyl or thio groups such that hydrolysis from the parental molecule yields hydroxyl or thio.

- 5 In its ester-forming role, R<sub>6a</sub> typically is bound to any acidic group such as, by way of example and not limitation, a -CO<sub>2</sub>H or -C(S)OH group, thereby resulting in -CO<sub>2</sub>R<sub>6a</sub>. R<sub>6a</sub> for example is deduced from the enumerated ester groups of WO 95/07920.

- 5 Other esters that are suitable for use herein are described in EP 632,048.  
 R<sub>6a</sub> also includes "double ester" forming profunctionalities such as

- CH<sub>2</sub>OC(O)OCH<sub>3</sub>, -CH<sub>2</sub>SCCOCH<sub>3</sub>, -CH<sub>2</sub>OCON(CH<sub>3</sub>)<sub>2</sub>, or alkyl- or aryl-acyloxyalkyl groups of the structure -CH(R<sub>1</sub> or W<sub>5</sub>)O((CO)R<sub>37</sub>) or -CH(R<sub>1</sub> or W<sub>5</sub>)((CO)OR<sub>38</sub>) (linked to oxygen of the acidic group) wherein R<sub>37</sub> and R<sub>38</sub> are alkyl, aryl, or alkylaryl groups (see U.S. patent 4,968,788). - For prodrug purposes, the ester typically chosen is one heretofore used for antibiotic drugs, in particular the cyclic carbonates, double esters, or the phthalidyl, aryl or alkyl esters.
- 25 As noted, R<sub>6a</sub>, R<sub>6c</sub> and R<sub>6b</sub> groups optionally are used to prevent side reactions with the protected group during synthetic procedures, so they function as protecting groups (PRT) during synthesis. For the most part the

- decision as to which groups to protect, when to do so, and the nature of the PRT will be dependent upon the chemistry of the reaction to be protected against (e.g., acidic, basic, oxidative, reductive or other conditions) and the intended direction of the synthesis. The PRT groups do not need to be, and generally are not, the same if the compound is substituted with multiple PRT. In general, PRT will be used to protect carboxyl, hydroxyl or amino groups. The order of deprotection to yield free groups is dependent upon the intended direction of the synthesis and the reaction conditions to be encountered, and may occur in any order as determined by the artisan.
- A very large number of R<sub>6a</sub> hydroxy protecting groups and R<sub>6c</sub> amide-forming groups and corresponding chemical cleavage reactions are described in "Protective Groups in Organic Chemistry", Theodora W. Greene (John Wiley & Sons, Inc., New York, 1991, ISBN 0-471-62301-6) ("Greene"). See also Kocienski, Philip J.; "Protecting Groups" (Georg Thieme Verlag Stuttgart, New York, 1994), which is incorporated by reference in its entirety herein. In particular Chapter 1, Protecting Groups: An Overview, pages 1-20, Chapter 2, Hydroxyl Protecting Groups, pages 21-94, Chapter 3, Diol Protecting Groups, pages 95-117, Chapter 4, Carboxyl Protecting Groups, pages 118-154, Chapter 5, Carbonyl Protecting Groups, pages 155-184. For R<sub>6a</sub> carboxylic acid, phosphonic acid, phosphonate, sulfonic acid and other protecting groups for W<sub>1</sub> acids see Greene as set forth below. Such groups include by way of example and not limitation, esters, amides, hydrazides, and the like.
- In some embodiments the R<sub>6a</sub> protected acidic group is an ester of the acidic group and R<sub>6a</sub> is the residue of a hydroxyl-containing functionality. In other embodiments, an R<sub>6c</sub> amino compound is used to protect the acid functionality. The residues of suitable hydroxyl or amino-containing functionalities are set forth above or are found in WO 95/07920. Of particular interest are the residues of amino acids, amino acid esters, polypeptides, or aryl alcohols. Typical amino acid, polypeptide and carboxyl-esterified amino acid residues are described on pages 11-18 and related text of WO 95/07920 as groups L1 or L2. WO 95/07920 expressly teaches the amidates of phosphonic acids, but it will be understood that such amidates are formed with any of the acid groups set forth herein and the amino acid residues set forth in WO 95/07920.
- Typical R<sub>6a</sub> esters for protecting W<sub>1</sub> acidic functionalities are also described in WO 95/07920, again understanding that the same esters can be formed with the acidic groups herein as with the phosphonate of the '920

publication. Typical ester groups are defined at least on WO 95/07920 pages 89-93 (under R<sup>31</sup> or R<sup>35</sup>), the table on page 105, and pages 21-23 (as R). Of particular interest are esters of unsubstituted aryl such as phenyl or arylalkyl such benzyl, or hydroxy-, halo-, alkoxy-, carboxy- and /or alkylestercarboxy- 5 substituted aryl or alkylaryl, especially phenyl, ortho-ethoxyphenyl, or C<sub>1</sub>-C<sub>4</sub> alkylestercarboxyphenyl (salicylate C<sub>1</sub>-C<sub>12</sub> alkylesters).

The protected acidic groups W<sub>1</sub>, particularly when using the esters or amides of WO 95/07920, are useful as prodrugs for oral administration. However, it is not essential that the W<sub>1</sub> acidic group be protected in order for 10 the compounds of this invention to be effectively administered by the oral route. When the compounds of the invention having protected groups, in particular amino acid amides or substituted and unsubstituted aryl esters are administered systemically or orally they are capable of hydrolytic cleavage *in vivo* to yield the free acid.

15 One or more of the acidic hydroxyls are protected. If more than one acidic hydroxyl is protected then the same or a different protecting group is employed, e.g., the esters may be different or the same, or a mixed amide and ester may be used.

More typically, protected amino groups include carbamates and amides, still more typically, -NHC(O)R<sub>1</sub> or -N=CR<sub>1</sub>N(R<sub>1</sub>)<sub>2</sub>. Another protecting group, also useful as a prodrug at the G<sub>1</sub> site, particularly for amino or -NH(R<sub>5</sub>), is:

20

see for example Alexander, J.; et al.; *J. Med. Chem.* 1996, 39, 480-486.

R<sub>6c</sub> is H or the residue of an amino-containing compound, in particular an amino acid, a polypeptide, a protecting group, -NHSO<sub>2</sub>R<sub>4</sub>, NHC(O)R<sub>4</sub>, -N(R<sub>4</sub>)<sub>2</sub>, NH<sub>2</sub> or -NH(R<sub>4</sub>)(H), whereby for example the carboxyl or

25

phosphonic acid groups of W<sub>1</sub> are reacted with the amine to form an amide, as in -C(O)R<sub>6c</sub>, -P(O)(R<sub>6c</sub>)<sub>2</sub> or -P(O)(OH)(R<sub>6c</sub>). In general, R<sub>6c</sub> has the structure R<sub>17</sub>C(O)CH(R<sub>16</sub>)NH-, where R<sub>17</sub> is OH, OR<sub>6a</sub>, OR<sub>5</sub>, an amino acid or a polypeptide residue.

Amino acids are low molecular weight compounds, on the order of less than about 1,000 MW, that contain at least one amino or imino group and at least one carboxyl group. Generally the amino acids will be found in nature, i.e., can be detected in biological material such as bacteria or other microbes, plants, animals or man. Suitable amino acids typically are alpha amino acids, i.e. compounds characterized by one amino or imino nitrogen atom separated from the carbon atom of one carboxyl group by a single substituted or

unsubstituted alpha carbon atom. Of particular interest are hydrophobic residues such as mono- or di-alkyl or aryl amino acids, cycloalkylamino acids and the like. These residues contribute to cell permeability by increasing the partition coefficient of the parental drug. Typically, the residue does not 5 contain a sulphydryl or guanidino substituent.

Naturally-occurring amino acid residues are those residues found naturally in plants, animals or microbes, especially proteins thereof.

Polypeptides most typically will be substantially composed of such naturally-occurring amino acid residues. These amino acids are glycine, alanine, 10 valine, leucine, isoleucine, serine, threonine, cysteine, methionine, glutamic acid, aspartic acid, lysine, hydroxylysine, arginine, histidine, phenylalanine, tyrosine, tryptophan, proline, asparagine, glutamine and hydroxyproline.

When R<sub>6b</sub> and R<sub>6c</sub> are single amino acid residues or polypeptides they usually are substituted at R<sub>3</sub>, W<sub>6</sub>, W<sub>1</sub> and/or W<sub>2</sub>, but typically only W<sub>1</sub> or 15 W<sub>2</sub>. These conjugates are produced by forming an amide bond between a carboxyl group of the amino acid (or C-terminal amino acid of a polypeptide for example) and W<sub>2</sub>. Similarly, conjugates are formed between W<sub>1</sub> and an amino group of an amino acid or polypeptide. Generally, only one of any site in the parental molecule is amidated with an amino acid as described herein, 20 although it is within the scope of this invention to introduce amino acids at more than one permitted site. Usually, a carboxyl group of W<sub>1</sub> is amidated with an amino acid. In general, the  $\alpha$ -amino or  $\alpha$ -carboxyl group of the amino acid or the terminal amino or carboxyl group of a polypeptide are bonded to the parental functionalities, i.e., carboxyl or amino groups in the 25 amino acid side chains generally are not used to form the amide bonds with the parental compound (although these groups may need to be protected during synthesis of the conjugates as described further below).

With respect to the carboxyl-containing side chains of amino acids or polypeptides it will be understood that the carboxyl group optionally will be blocked, e.g. by R<sub>6a</sub>, esterified with R<sub>5</sub> or amidated with R<sub>6c</sub>. Similarly, the amino side chains R<sub>16</sub> optionally will be blocked with R<sub>6b</sub> or substituted with R<sub>5</sub>.

Such ester or amide bonds with side chain amino or carboxyl groups, like the esters or amides with the parental molecule, optionally are 35 hydrolyzable in vivo or in vitro under acidic (pH < 3) or basic (pH > 10) conditions. Alternatively, they are substantially stable in the gastrointestinal tract of humans but are hydrolyzed enzymatically in blood or in intracellular

environments. The esters or amino acid or polypeptide amides also are useful as intermediates for the preparation of the parental molecule containing free amino or carboxyl groups. The free acid or base of the parental compound, for example, is readily formed from the esters or amino acid or 5 polypeptide conjugates of this invention by conventional hydrolysis procedures.

When an amino acid residue contains one or more chiral centers, any of the D, L, meso, threo or erythro (as appropriate) racemates, scalemates or mixtures thereof may be used. In general, if the intermediates are to be 10 hydrolyzed non-enzymatically (as would be the case where the amides are used as chemical intermediates for the free acids or free amines), D isomers are useful. On the other hand, L isomers are more versatile since they can be susceptible to both non-enzymatic and enzymatic hydrolysis, and are more efficiently transported by amino acid or dipeptidyl transport systems in the 15 gastrointestinal tract.

Polypeptides are polymers of amino acids in which a carboxyl group of one amino acid monomer is bonded to an amino or imino group of the next amino acid monomer by an amide bond. Polypeptides include dipeptides, low molecular weight polypeptides (about 1500-5000MW) and proteins.

Proteins optionally contain 3, 5, 10, 50, 75, 100 or more residues, and suitably are substantially sequence-homologous with human, animal, plant or microbial proteins. They include enzymes (e.g., hydrogen peroxidase) as well as immunogens such as KLH, or antibodies or proteins of any type against which one wishes to raise an immune response. The nature and identity of the polypeptide may vary widely.

The polypeptide amides are useful as immunogens in raising antibodies against either the polypeptide (if it is not immunogenic in the animal to which it is administered) or against the epitopes on the remainder of the compound of this invention.

Antibodies capable of binding to the parental non-peptidyl compound are used to separate the parental compound from mixtures, for example in diagnosis or manufacturing of the parental compound. The conjugates of parental compound and polypeptide generally are more immunogenic than the polypeptides in closely homologous animals, and therefore make the polypeptide more immunogenic for facilitating raising antibodies against it. Accordingly, the polypeptide or protein may not need to be immunogenic in an animal typically used to raise antibodies, e.g., rabbit, mouse, horse, or rat, but the final product conjugate should be immunogenic in at least one of such animals. The polypeptide optionally contains a peptidolytic enzyme cleavage site at the peptide bond between the first and second residues adjacent to the acidic heteroatom. Such cleavage sites are flanked by enzymatic recognition structures, e.g. a particular sequence of residues recognized by a peptidolytic enzyme.

Peptidolytic enzymes for cleaving the polypeptide conjugates of this invention are well known, and in particular include carboxypeptidases. Carboxypeptidases digest polypeptides by removing C-terminal residues, and are specific in many instances for particular C-terminal sequences. Such enzymes and their substrate requirements in general are well known. For example, a dipeptide (having a given pair of residues and a free carboxyl terminus) is covalently bonded through its  $\alpha$ -amino group to the phosphorus

or carbon atoms of the compounds herein. In embodiments where W<sub>1</sub> is phosphonate it is expected that this peptide will be cleaved by the appropriate peptidolytic enzyme, leaving the carboxyl of the proximal amino acid residue to autocatalytically cleave the phosphonoamidate bond.

- Tripeptide residues are also useful as R<sub>6b</sub> or R<sub>6c</sub>. When W<sub>1</sub> is phosphonate, the sequence -X<sub>4</sub>-pro-X<sub>5</sub>- (where X<sub>4</sub> is any amino acid residue and X<sub>5</sub> is an amino acid residue, a carboxyl ester of proline, or hydrogen) will be cleaved by luminal carboxypeptidase to yield X<sub>4</sub> with a free carboxyl, which in turn is expected to autocatalytically cleave the phosphonoamidate bond. The carboxy group of X<sub>5</sub> optionally is esterified with benzyl.

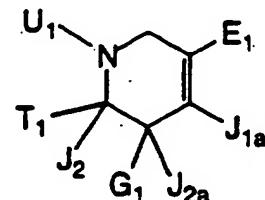

- 35      Dipeptide or tripeptide species can be selected on the basis of known transport properties and/or susceptibility to peptidases that can affect transport to intestinal mucosal or other cell types. Dipeptides and tripeptides

lacking an  $\alpha$ -amino group are transport substrates for the peptide transporter found in brush border membrane of intestinal mucosal cells (Bai, J.P.F., "Pharm Res." 9:969-978 (1992). Transport competent peptides can thus be used to enhance bioavailability of the amide compounds. Di- or tripeptides having one or more amino acids in the D configuration are also compatible with peptide transport and can be utilized in the amide compounds of this invention. Amino acids in the D configuration can be used to reduce the susceptibility of a di- or tripeptide to hydrolysis by proteases common to the brush border such as aminopeptidase N (EC 3.4.11.2). In addition, di- or tripeptides alternatively are selected on the basis of their relative resistance to hydrolysis by proteases found in the lumen of the intestine. For example, tripeptides or polypeptides lacking asp and/or glu are poor substrates for aminopeptidase A (EC 3.4.11.7), di- or tripeptides lacking amino acid residues on the N-terminal side of hydrophobic amino acids (leu, tyr, phe, val, trp) are poor substrates for endopeptidase 24.11 (EC 3.4.24.11), and peptides lacking a pro residue at the penultimate position at a free carboxyl terminus are poor substrates for carboxypeptidase P (EC 3.4.17). Similar considerations can also be applied to the selection of peptides that are either relatively resistant or relatively susceptible to hydrolysis by cytosolic, renal, hepatic, serum or other peptidases. Such poorly cleaved polypeptide amides are immunogens or are useful for bonding to proteins in order to prepare immunogens.

Another embodiment of the invention relates to compositions of the formula (VII) or (VIII):

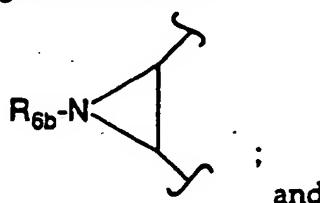

(VII)

(VIII)

wherein E<sub>1</sub>, G<sub>1</sub>, T<sub>1</sub>, U<sub>1</sub>, J<sub>1</sub>, J<sub>1a</sub>, J<sub>2</sub> and J<sub>2a</sub> are as defined above except:

T<sub>1</sub> is -NR<sub>1</sub>W<sub>3</sub>, a heterocycle, or is taken together with G<sub>1</sub> to form a group having the structure

$X_1$  is a bond, -O-, -N(H)-, -N(R<sub>5</sub>)-, -S-, -SO-, or -SO<sub>2</sub>-; and provided, however, that compounds are excluded wherein U<sub>1</sub> is H or -CH<sub>2</sub>CH(OH)CH<sub>2</sub>(OH); and the salts, solvates, resolved enantiomers and purified diastereomers thereof.

5 Each of the typical or ordinary embodiments of formula (I)-(VI) detailed above are also typical embodiments of formula (VII) and (VIII).

The synthesis of a number of compounds of the formula (VII) and (VIII) wherein U<sub>1</sub> is H or -CH<sub>2</sub>CH(OH)CH<sub>2</sub>(OH) are provided in Nishimura, Y.; et al.; I. Antibiotics, 1993, 46(2), 300; 46(12), 1883; and Nat. Prod. Lett. 1992, 1(1), 39. Attachement of U<sub>1</sub> groups of the present invention proceed as described therein.

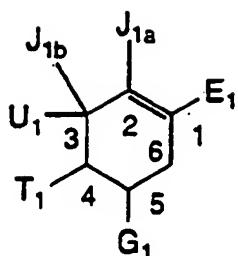

#### Stereoisomers

15 The compounds of the invention are enriched or resolved optical isomers at any or all asymmetric atoms. For example, the chiral centers apparent from the depictions are provided as the chiral isomers or racemic mixtures. Both racemic and diasteromeric mixtures, as well as the individual optical isomers isolated or synthesized, substantially free of their 20 enantiomeric or diastereomeric partners, are all within the scope of the invention. The racemic mixtures are separated into their individual, substantially optically pure isomers through well-known techniques such as, for example, the separation of diastereomeric salts formed with optically active adjuncts, e.g., acids or bases followed by conversion back to the optically 25 active substances. In most instances, the desired optical isomer is synthesized by means of stereospecific reactions, beginning with the appropriate stereoisomer of the desired starting material.

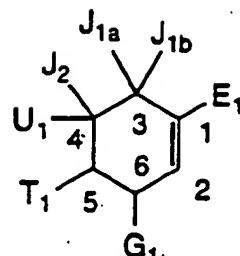

Exemplary stereochemistry of the compounds of this invention is set forth below in Table C.

The compounds of the invention can also exist as tautomeric isomers in certain cases. For example, ene-amine tautomers can exist for imidazole, guanidine, amidine, and tetrazole systems and all their possible tautomeric forms are within the scope of the invention.

Exemplary Enumerated Compounds.

By way of example and not limitation, embodiment compounds are named below in tabular format (Table 6). Generally, each compound is depicted as a substituted nucleus in which the nucleus is designated by capital letter and each substituent is designated in order by lower case letter or number. Tables 1a and 1b are a schedule of nuclei which differ principally by the position of ring unsaturation and the nature of ring substituents. Each nucleus is given a alphabetical designation from Tables 1a and 1b, and this designation appears first in each compound name. Similarly, Tables 2a-av, 3a-b, 4a-c, and 5a-d list the selected Q<sub>1</sub>, Q<sub>2</sub>, Q<sub>3</sub> and Q<sub>4</sub> substituents, again by letter or number designation. Accordingly, each named compound will be depicted by a capital letter designating the nucleus from Table 1a-1b, followed by a number designating the Q<sub>1</sub> substituent, a lower case letter designating the Q<sub>2</sub> substituent, a number designating the Q<sub>3</sub> substituent, and a lower case letter or letters designating the Q<sub>4</sub> substituent. Thus, structure 8, scheme 1, is represented by A.49.a.4.i. Q<sub>1</sub>-Q<sub>4</sub>, it should be understood, do not represent groups or atoms but are simply connectivity designations.

### Salts and Hydrates

5       The compositions of this invention optionally comprise salts of the compounds herein, especially pharmaceutically acceptable non-toxic salts containing, for example,  $\text{Na}^+$ ,  $\text{Li}^+$ ,  $\text{K}^+$ ,  $\text{Ca}^{++}$  and  $\text{Mg}^{++}$ . Such salts may include those derived by combination of appropriate cations such as alkali and alkaline earth metal ions or ammonium and quaternary amino ions with an acid anion moiety, typically the W<sub>1</sub> group carboxylic acid. Monovalent salts are preferred if a water soluble salt is desired.

10      Metal salts typically are prepared by reacting the metal hydroxide with a compound of this invention. Examples of metal salts which are prepared in this way are salts containing  $\text{Li}^+$ ,  $\text{Na}^+$ , and  $\text{K}^+$ . A less soluble metal salt can 15 be precipitated from the solution of a more soluble salt by addition of the suitable metal compound.

20      In addition, salts may be formed from acid addition of certain organic and inorganic acids, e.g., HCl, HBr,  $\text{H}_2\text{SO}_4$ , or organic sulfonic acids, to basic centers, typically amines of group G<sub>1</sub>, or to acidic groups such as E<sub>1</sub>. Finally, it 25 is to be understood that the compositions herein comprise compounds of the invention in their un-ionized, as well as zwitterionic form, and combinations with stoichiometric amounts of water as in hydrates.

30      Also included within the scope of this invention are the salts of the parental compounds with one or more amino acids. Any of the amino acids described above are suitable, especially the naturally-occurring amino acids found as protein components, although the amino acid typically is one bearing a side chain with a basic or acidic group, e.g., lysine, arginine or glutamic acid, or a neutral group such as glycine, serine, threonine, alanine, isoleucine, or leucine.

### Methods of Inhibition of Neuraminidase.

Another aspect of the invention relates to methods of inhibiting the activity of neuraminidase comprising the step of treating a sample suspected of containing neuraminidase with a compound of the invention.

35      Compositions of the invention act as inhibitors of neuraminidase, as intermediates for such inhibitors or have other utilities as described below. The inhibitors will bind to locations on the surface or in a cavity of neuraminidase having a geometry unique to neuraminidase. Compositions

binding neuraminidase may bind with varying degrees of reversibility. Those compounds binding substantially irreversibly are ideal candidates for use in this method of the invention. Once labeled, the substantially irreversibly binding compositions are useful as probes for the detection of neuraminidase.

- 5 Accordingly, the invention relates to methods of detecting neuraminidase in a sample suspected of containing neuraminidase comprising the steps of: treating a sample suspected of containing neuraminidase with a composition comprising a compound of the invention bound to a label; and observing the effect of the sample on the activity of the label. Suitable labels are well known  
10 in the diagnostics field and include stable free radicals, fluorophores, radioisotopes, enzymes, chemiluminescent groups and chromogens. The compounds herein are labeled in conventional fashion using functional groups such as hydroxyl or amino.

Within the context of the invention samples suspected of containing  
15 neuraminidase include natural or man-made materials such as living organisms; tissue or cell cultures; biological samples such as biological material samples (blood, serum, urine, cerebrospinal fluid, tears, sputum, saliva, tissue samples, and the like); laboratory samples; food, water, or air samples; bioproduct samples such as extracts of cells, particularly recombinant  
20 cells synthesizing a desired glycoprotein; and the like. Typically the sample will be suspected of containing an organism which produces neuraminidase, frequently a pathogenic organism such as a virus. Samples can be contained in any medium including water and organic solvent\water mixtures.  
Samples include living organisms such as humans, and man made materials  
25 such as cell cultures.

The treating step of the invention comprises adding the composition of the invention to the sample or it comprises adding a precursor of the composition to the sample. The addition step comprises any method of administration as described above.

- 30 If desired, the activity of neuraminidase after application of the composition can be observed by any method including direct and indirect methods of detecting neuraminidase activity. Quantitative, qualitative, and semiquantitative methods of determining neuraminidase activity are all contemplated. Typically one of the screening methods described above are applied, however, any other method such as observation of the physiological properties of a living organism are also applicable.

Organisms that contain neuraminidase include bacteria (*Vibrio*

cholerae, Clostridium perfringens, Streptococcus pneumoniae, and Arthrobacter sialophilus) and viruses (especially orthomyxoviruses or paramyxoviruses such as influenza virus A and B, parainfluenza virus, mumps virus, Newcastle disease virus, fowl plague virus, and sendai virus).

- 5 Inhibition of neuraminidase activity obtained from or found within any of these organisms is within the objects of this invention. The virology of influenza viruses is described in "Fundamental Virology" (Raven Press, New York, 1986), Chapter 24. The compounds of this invention are useful in the treatment or prophylaxis of such infections in animals, e.g. duck, rodents, or  
10 swine, or in man.

However, in screening compounds capable of inhibiting influenza viruses it should be kept in mind that the results of enzyme assays may not correlate with cell culture assays, as shown Table 1 of Chandler et al., *supra*. Thus, a plaque reduction assay should be the primary screening tool.

15

#### Screens for Neuraminidase Inhibitors.

- Compositions of the invention are screened for inhibitory activity against neuraminidase by any of the conventional techniques for evaluating enzyme activity. Within the context of the invention, typically compositions  
20 are first screened for inhibition of neuraminidase *in vitro* and compositions showing inhibitory activity are then screened for activity *in vivo*. Compositions having *in vitro* Ki (inhibitory constants) of less than about 5 X 10<sup>-6</sup> M, typically less than about 1 X 10<sup>-7</sup> M and preferably less than about 5 X 10<sup>-8</sup> M are preferred for *in vivo* use.

25

- Useful *in vitro* screens have been described in detail and will not be elaborated here. However, Itzstein, M. von et al.; "Nature", 363(6428):418-423 (1993), in particular page 420, column 2, full paragraph 3, to page 421, column 2, first partial paragraph, describes a suitable *in vitro* assay of Potier, M.; et al.; "Analyst Biochem.", 94:287-296 (1979), as modified by Chong, A.K.J.; et al.; "Biochem. Biophys. Acta", 1077:65-71 (1991); and Colman, P. M.; et al.; International Publication No. WO 92/06691 (Int. App. No. PCT/AU90/00501, publication date April 30, 1992) page 34, line 13, to page 35, line 16, describes another useful *in vitro* screen.

- 35 *In vivo* screens have also been described in detail, see Itzstein, M. von et al.; *op. cit.*, in particular page 421, column 2, first full paragraph, to page 423, column 2, first partial paragraph, and Colman, P. M.; et al.; *op. cit.* page 36, lines 1-38, describe suitable *in vivo* screens.

Pharmaceutical Formulations and Routes of Administration.

The compounds of this invention are formulated with conventional carriers and excipients, which will be selected in accord with ordinary practice. Tablets will contain excipients, glidants, fillers, binders and the like. Aqueous 5 formulations are prepared in sterile form, and when intended for delivery by other than oral administration generally will be isotonic. All formulations will optionally contain excipients such as those set forth in the "Handbook of Pharmaceutical Excipients" (1986). Excipients include ascorbic acid and other antioxidants, chelating agents such as EDTA, carbohydrates such as dextrin, 10 hydroxyalkylcellulose, hydroxyalkylmethylcellulose, stearic acid and the like. The pH of the formulations ranges from about 3 to about 11, but is ordinarily about 7 to 10.

One or more compounds of the invention (herein referred to as the active ingredients) are administered by any route appropriate to the condition 15 to be treated. Suitable routes include oral, rectal, nasal, topical (including buccal and sublingual), vaginal and parenteral (including subcutaneous, intramuscular, intravenous, intradermal, intrathecal and epidural), and the like. It will be appreciated that the preferred route may vary with for example the condition of the recipient. An advantage of the compounds of this 20 invention is that they are orally bioavailable and can be dosed orally; it is not necessary to administer them by intrapulmonary or intranasal routes. Surprisingly, the anti-influenza compounds of WO 91/16320, WO 92/06691 and U.S. Patent 5,360,817 are successfully administered by the oral or intraperitoneal routes. See Example 161 infra.

While it is possible for the active ingredients to be administered alone 25 it may be preferable to present them as pharmaceutical formulations. The formulations, both for veterinary and for human use, of the invention comprise at least one active ingredient, as above defined, together with one or more acceptable carriers therefor and optionally other therapeutic ingredients. 30 The carrier(s) must be "acceptable" in the sense of being compatible with the other ingredients of the formulation and physiologically innocuous to the recipient thereof.

The formulations include those suitable for the foregoing 35 administration routes. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. Techniques and formulations generally are found in Remington's Pharmaceutical Sciences (Mack Publishing Co., Easton, PA).

Such methods include the step of bringing into association the active ingredient with the carrier which constitutes one or more accessory ingredients. In general the formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both, and then, if necessary, shaping the product.

Formulations of the invention suitable for oral administration are prepared as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The active ingredient may also be presented as a bolus, electuary or paste.

A tablet is made by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, preservative, surface active or dispersing agent. Molded tablets may be made by molding in a suitable machine a mixture of the powdered active ingredient moistened with an inert liquid diluent. The tablets may optionally be coated or scored and optionally are formulated so as to provide slow or controlled release of the active ingredient therefrom.

For infections of the eye or other external tissues e.g. mouth and skin, the formulations are preferably applied as a topical ointment or cream containing the active ingredient(s) in an amount of, for example, 0.075 to 20% w/w (including active ingredient(s) in a range between 0.1% and 20% in increments of 0.1% w/w such as 0.6% w/w, 0.7% w/w, etc.), preferably 0.2 to 15% w/w and most preferably 0.5 to 10% w/w. When formulated in an ointment, the active ingredients may be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with an oil-in-water cream base.

If desired, the aqueous phase of the cream base may include, for example, at least 30% w/w of a polyhydric alcohol, i.e. an alcohol having two or more hydroxyl groups such as propylene glycol, butane 1,3-diol, mannitol, sorbitol, glycerol and polyethylene glycol (including PEG 400) and mixtures thereof. The topical formulations may desirably include a compound which enhances absorption or penetration of the active ingredient through the skin or other affected areas. Examples of such dermal penetration enhancers

include dimethyl sulphoxide and related analogs.

- The oily phase of the emulsions of this invention may be constituted from known ingredients in a known manner. While the phase may comprise merely an emulsifier (otherwise known as an emulgent), it
- 5 desirably comprises a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a stabilizer. It is also preferred to include both an oil and a fat. Together, the emulsifier(s) with or without stabilizer(s) make up the so-called emulsifying wax, and the wax
- 10 together with the oil and fat make up the so-called emulsifying ointment base which forms the oily dispersed phase of the cream formulations.

- Emulgents and emulsion stabilizers suitable for use in the formulation of the invention include Tween® 60, Span® 80, cetostearyl alcohol, benzyl alcohol, myristyl alcohol, glyceryl mono-stearate and sodium lauryl sulfate.
- 15 The choice of suitable oils or fats for the formulation is based on achieving the desired cosmetic properties. The cream should preferably be a non-greasy, non-staining and washable product with suitable consistency to avoid leakage from tubes or other containers. Straight or branched chain, mono- or dibasic alkyl esters such as di-isoadipate, isocetyl stearate, propylene
- 20 glycol diester of coconut fatty acids, isopropyl myristate, decyl oleate, isopropyl palmitate, butyl stearate, 2-ethylhexyl palmitate or a blend of branched chain esters known as Crodamol CAP may be used, the last three being preferred esters. These may be used alone or in combination depending on the properties required. Alternatively, high melting point lipids such as white
- 25 soft paraffin and/or liquid paraffin or other mineral oils are used.

- Formulations suitable for topical administration to the eye also include eye drops wherein the active ingredient is dissolved or suspended in a suitable carrier, especially an aqueous solvent for the active ingredient. The active ingredient is preferably present in such formulations in a concentration of 0.5 to 20%, advantageously 0.5 to 10% particularly about 1.5% w/w.

- Formulations suitable for topical administration in the mouth include lozenges comprising the active ingredient in a flavored basis, usually sucrose and acacia or tragacanth; pastilles comprising the active ingredient in an inert basis such as gelatin and glycerin, or sucrose and acacia; and mouthwashes comprising the active ingredient in a suitable liquid carrier.

- Formulations for rectal administration may be presented as a suppository with a suitable base comprising for example cocoa butter or a

salicylate.

Formulations suitable for intrapulmonary or nasal administration have a particle size for example in the range of 0.1 to 500 microns (including particle sizes in a range between 0.1 and 500 microns in increments microns such as 0.5, 1, 30 microns, 35 microns, etc.), which is administered by rapid inhalation through the nasal passage or by inhalation through the mouth so as to reach the alveolar sacs. Suitable formulations include aqueous or oily solutions of the active ingredient. Formulations suitable for aerosol or dry powder administration may be prepared according to conventional methods and may be delivered with other therapeutic agents such as compounds heretofore used in the treatment or prophylaxis of influenza A or B infections as described below.

Formulations suitable for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or spray formulations containing in addition to the active ingredient such carriers as are known in the art to be appropriate.

Formulations suitable for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents.

The formulations are presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example water for injection, immediately prior to use. Extemporaneous injection solutions and suspensions are prepared from sterile powders, granules and tablets of the kind previously described. Preferred unit dosage formulations are those containing a daily dose or unit daily sub-dose, as herein above recited, or an appropriate fraction thereof, of the active ingredient.

It should be understood that in addition to the ingredients particularly mentioned above the formulations of this invention may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavoring agents.

The invention further provides veterinary compositions comprising at least one active ingredient as above defined together with a veterinary carrier

therefor.

Veterinary carriers are materials useful for the purpose of administering the composition and may be solid, liquid or gaseous materials which are otherwise inert or acceptable in the veterinary art and are compatible with the active ingredient. These veterinary compositions may be administered orally, parenterally or by any other desired route.

Compounds of the invention are used to provide controlled release pharmaceutical formulations containing as active ingredient one or more compounds of the invention ("controlled release formulations") in which the release of the active ingredient are controlled and regulated to allow less frequency dosing or to improve the pharmacokinetic or toxicity profile of a given active ingredient.

Effective dose of active ingredient depends at least on the nature of the condition being treated, toxicity, whether the compound is being used prophylactically (lower doses) or against an active influenza infection, the method of delivery, and the pharmaceutical formulation, and will be determined by the clinician using conventional dose escalation studies. It can be expected to be from about 0.0001 to about 100 mg/kg body weight per day. Typically, from about 0.01 to about 10 mg/kg body weight per day. More typically, from about .01 to about 5 mg/kg body weight per day. More typically, from about .05 to about 0.5 mg/kg body weight per day. For example, for inhalation the daily candidate dose for an adult human of approximately 70 kg body weight will range from 1 mg to 1000 mg, preferably between 5 mg and 500 mg, and may take the form of single or multiple doses.

Active ingredients of the invention are also used in combination with other active ingredients. Such combinations are selected based on the condition to be treated, cross-reactivities of ingredients and pharmacological properties of the combination. For example, when treating viral infections of the respiratory system, in particular influenza infection, the compositions of the invention are combined with antivirals (such as amantadine, rimantadine and ribavirin), mucolytics, expectorants, bronchialdilators, antibiotics, antipyretics, or analgesics. Ordinarily, antibiotics, antipyretics, and analgesics are administered together with the compounds of this invention.

#### Metabolites of the Compounds of the Invention

Also falling within the scope of this invention are the *in vivo* metabolic products of the compounds described herein, to the extent such

products are novel and unobvious over the prior art. Such products may result for example from the oxidation, reduction, hydrolysis, amidation, esterification and the like of the administered compound, primarily due to enzymatic processes. Accordingly, the invention includes novel and

5 unobvious compounds produced by a process comprising contacting a compound of this invention with a mammal for a period of time sufficient to yield a metabolic product thereof. Such products typically are identified by preparing a radiolabelled (e.g. C<sup>14</sup> or H<sup>3</sup>) compound of the invention, administering it parenterally in a detectable dose (e.g. greater than about 0.5

10 mg/kg) to an animal such as rat, mouse, guinea pig, monkey, or to man, allowing sufficient time for metabolism to occur (typically about 30 seconds to 30 hours) and isolating its conversion products from the urine, blood or other biological samples. These products are easily isolated since they are labeled (others are isolated by the use of antibodies capable of binding epitopes

15 surviving in the metabolite). The metabolite structures are determined in conventional fashion, e.g. by MS or NMR analysis. In general, analysis of metabolites is done in the same way as conventional drug metabolism studies well-known to those skilled in the art. The conversion products, so long as they are not otherwise found *in vivo*, are useful in diagnostic assays for

20 therapeutic dosing of the compounds of the invention even if they possess no neuraminidase inhibitory activity of their own.

Additional Uses for the Compounds of This Invention.

The compounds of this invention, or the biologically active substances

25 produced from these compounds by hydrolysis or metabolism *in vivo*, are used as immunogens or for conjugation to proteins, whereby they serve as components of immunogenic compositions to prepare antibodies capable of binding specifically to the protein, to the compounds or to their metabolic products which retain immunologically recognized epitopes (sites of antibody binding). The immunogenic compositions therefore are useful as

30 intermediates in the preparation of antibodies for use in diagnostic, quality control, or the like, methods or in assays for the compounds or their novel metabolic products. The compounds are useful for raising antibodies against otherwise non-immunogenic polypeptides, in that the compounds serve as haptic sites stimulating an immune response that cross-reacts with the

35 unmodified conjugated protein.

The hydrolysis products of interest include products of the hydrolysis of

the protected acidic and basic groups discussed above. As noted above, the acidic or basic amides comprising immunogenic polypeptides such as albumin or keyhole limpet hemocyanin generally are useful as immunogens. The metabolic products described above may retain a substantial degree of 5 immunological cross reactivity with the compounds of the invention. Thus, the antibodies of this invention will be capable of binding to the unprotected compounds of the invention without binding to the protected compounds; alternatively the metabolic products, will be capable of binding to the protected compounds and/or the metabolitic products without binding to the 10 protected compounds of the invention, or will be capable of binding specifically to any one or all three. The antibodies desirably will not substantially cross-react with naturally-occurring materials. Substantial cross-reactivity is reactivity under specific assay conditions for specific analytes sufficient to interfere with the assay results.

15 The immunogens of this invention contain the compound of this invention presenting the desired epitope in association with an immunogenic substance. Within the context of the invention such association means covalent bonding to form an immunogenic conjugate (when applicable) or a mixture of non-covalently bonded materials, or a 20 combination of the above. Immunogenic substances include adjuvants such as Freund's adjuvant, immunogenic proteins such as viral, bacterial, yeast, plant and animal polypeptides, in particular keyhole limpet hemocyanin, serum albumin, bovine thyroglobulin or soybean trypsin inhibitor, and immunogenic polysaccharides. Typically, the compound having the structure 25 of the desired epitope is covalently conjugated to an immunogenic polypeptide or polysaccharide by the use of a polyfunctional (ordinarily bifunctional) cross-linking agent. Methods for the manufacture of hapten immunogens are conventional *per se*, and any of the methods used heretofore for conjugating haptens to immunogenic polypeptides or the like 30 are suitably employed here as well, taking into account the functional groups on the precursors or hydrolytic products which are available for cross-linking and the likelihood of producing antibodies specific to the epitope in question as opposed to the immunogenic substance.

35 Typically the polypeptide is conjugated to a site on the compound of the invention distant from the epitope to be recognized.

The conjugates are prepared in conventional fashion. For example, the cross-linking agents N-hydroxysuccinimide, succinic anhydride or

alkN=C=Nalk are useful in preparing the conjugates of this invention. The conjugates comprise a compound of the invention attached by a bond or a linking group of 1-100, typically, 1-25, more typically 1-10 carbon atoms to the immunogenic substance. The conjugates are separated from starting materials and by products using chromatography or the like, and then are sterile filtered and vailed for storage.

The compounds of this invention are cross-linked for example through any one or more of the following groups: a hydroxyl group of U<sub>1</sub>; a carboxyl group of E<sub>1</sub>; a carbon atom of U<sub>1</sub>, E<sub>1</sub>, G<sub>1</sub>, or T<sub>1</sub>, in substitution of H; and an amine group of G<sub>1</sub>. Included within such compounds are amides of polypeptides where the polypeptide serves as an above-described R<sub>6c</sub> or R<sub>6b</sub> groups.

Animals are typically immunized against the immunogenic conjugates or derivatives and antisera or monoclonal antibodies prepared in conventional fashion.

The compounds of the invention are useful for maintaining the structural integrity of glycoproteins in recombinant cell culture, i.e., they are added to fermentations in which glycoproteins are being produced for recovery so as to inhibit neuraminidase-catalyzed cleavage of the desired glycoproteins. This is of particular value in the recombinant synthesis of proteins in heterologous host cells that may disadvantageously degrade the carbohydrate portion of the protein being synthesized.

The compounds of the invention are polyfunctional. As such they represent a unique class of monomers for the synthesis of polymers. By way of example and not limitation, the polymers prepared from the compounds of this invention include polyamides and polyesters.

The present compounds are used as monomers to provide access to polymers having unique pendent functionalities. The compounds of this invention are useful in homopolymers, or as comonomers with monomers which do not fall within the scope of the invention. Homopolymers of the compounds of this invention will have utility as cation exchange agents (polyesters or polyamides) in the preparation of molecular sieves (polyamides), textiles, fibers, films, formed articles and the like where the acid functionality E<sub>1</sub> is esterified to a hydroxyl group in U<sub>1</sub>, for example, whereby the pendant basic group G<sub>1</sub> is capable of binding acidic functionalities such as are found in polypeptides whose purification is desired. Polyamides are prepared by cross-linking E<sub>1</sub> and G<sub>1</sub>, with U<sub>1</sub> and the adjacent portion of the

ring remaining free to function as a hydrophilic or hydrophobic affinity group, depending up the selection of the U<sub>1</sub> group. The preparation of these polymers from the compounds of the invention is conventional per se.

5 The compounds of the invention are also useful as a unique class of polyfunctional surfactants. Particularly when U<sub>1</sub> does not contain a hydrophilic substituent and is, for example, alkyl or alkoxy, the compounds have the properties of bi-functional surfactants. As such they have useful surfactant, surface coating, emulsion modifying, rheology modifying and surface wetting properties.

10 As polyfunctional compounds with defined geometry and carrying simultaneously polar and non-polar moieties, the compounds of the invention are useful as a unique class of phase transfer agents. By way of example and not limitation, the compounds of the invention are useful in phase transfer catalysis and liquid/liquid ion extraction (LIX).

15 The compounds of the invention optionally contain asymmetric carbon atoms in groups U<sub>1</sub>, E<sub>1</sub>, G<sub>1</sub>, and T<sub>1</sub>. As such, they are a unique class of chiral auxiliaries for use in the synthesis or resolution of other optically active materials. For example, a racemic mixture of carboxylic acids can be resolved into its component enantiomers by: 1) forming a mixture of diastereomeric esters or amides with a compound of the invention wherein U<sub>1</sub> is an asymmetric hydroxyalkane or amino alkane group; 2) separating the diastereomers; and 3) hydrolyzing the ester structure. Racemic alcohols are separated by ester formation with an acid group of E<sub>1</sub>. Further, such a method can be used to resolve the compounds of the invention themselves if optically active acids or alcohols are used instead of racemic starting materials.

20 The compounds of this invention are useful as linkers or spacers in preparing affinity absorption matrices, immobilized enzymes for process control, or immunoassay reagents. The compounds herein contain a multiplicity of functional groups that are suitable as sites for cross-linking desired substances. For example, it is conventional to link affinity reagents such as hormones, peptides, antibodies, drugs, and the like to insoluble substrates. These insolublized reagents are employed in known fashion to absorb binding partners for the affinity reagents from manufactured preparations, diagnostic samples and other impure mixtures. Similarly, 25 immobilized enzymes are used to perform catalytic conversions with facile recovery of enzyme. Bifunctional compounds are commonly used to link analytes to detectable groups in preparing diagnostic reagents.

Many functional groups in the compounds of this invention are suitable for use in cross-linking. For example, the carboxylic or phosphonic acid of group E<sub>1</sub> is used to form esters with alcohols or amides with amines of the reagent to be cross-linked. The G<sub>1</sub> sites substituted with OH, NHR<sub>1</sub>, SH, 5 azido (which is reduced to amino if desired before cross-linking), CN, NO<sub>2</sub>, amino, guanidino, halo and the like are suitable sites. Suitable protection of reactive groups will be used where necessary while assembling the cross-linked reagent to prevent polymerization of the bifunctional compound of this invention. In general, the compounds here are used by linking them 10 through carboxylic or phosphonic acid to the hydroxyl or amino groups of the first linked partner, then covalently bonded to the other binding partner through a T<sub>1</sub> or G<sub>1</sub> group. For example a first binding partner such as a steroid hormone is esterified to the carboxylic acid of a compound of this invention and then this conjugate is cross-linked through a G<sub>1</sub> hydroxyl to 15 cyanogen bromide activated Sepaharose, whereby immobilized steroid is obtained. Other chemistries for conjugation are well known. See for example Maggio, "Enzyme-Immunoassay" (CRC, 1988, pp 71-135) and references cited therein.

As noted above, the therapeutically useful compounds of this 20 invention in which the W<sub>1</sub>, or G<sub>1</sub> carboxyl, hydroxyl or amino groups are protected are useful as oral or sustained release forms. In these uses the protecting group is removed *in vivo*, e.g., hydrolyzed or oxidized, so as to yield the free carboxyl, amino or hydroxyl. Suitable esters or amides for this utility are selected based on the substrate specificity of esterases and/or 25 carboxypeptidases expected to be found within cells where precursor hydrolysis is desired. To the extent that the specificity of these enzymes is unknown, one will screen a plurality of the compounds of this invention until the desired substrate specificity is found. This will be apparent from the appearance of free compound or of antiviral activity. One generally selects 30 amides or esters of the invention compound that are (i) not hydrolyzed or hydrolyzed comparatively slowly in the upper gut, (ii) gut and cell permeable and (iii) hydrolyzed in the cell cytoplasm and/or systemic circulation. Screening assays preferably use cells from particular tissues that are susceptible to influenza infection, e.g. the mucous membranes of the 35 bronchopulmonary tract. Assays known in the art are suitable for determining *in vivo* bioavailability including intestinal lumen stability, cell permeation, liver homogenate stability and plasma stability assays. However,

even if the ester, amide or other protected derivatives are not converted *in vivo* to the free carboxyl, amino or hydroxyl groups, they remain useful as chemical intermediates.

5       Exemplary Methods of Making the Compounds of the Invention.

The invention also relates to methods of making the compositions of the invention. The compositions are prepared by any of the applicable techniques of organic synthesis. Many such techniques are well known in the art. However, many of the known techniques are elaborated in 10 "Compendium of Organic Synthetic Methods" (John Wiley & Sons, New York), Vol. 1, Ian T. Harrison and Shuyen Harrison, 1971; Vol. 2, Ian T. Harrison and Shuyen Harrison, 1974; Vol. 3, Louis S. Hegedus and Leroy Wade, 1977; Vol. 4, Leroy G. Wade, Jr., 1980; Vol. 5, Leroy G. Wade, Jr., 1984; and Vol. 6, Michael B. Smith; as well as March, J., "Advanced Organic 15 Chemistry, Third Edition", (John Wiley & Sons, New York, 1985), "Comprehensive Organic Synthesis. Selectivity, Strategy & Efficiency in Modern Organic Chemistry. In 9 Volumes", Barry M. Trost, Editor-in-Chief (Pergamon Press, New York, 1993 printing).

A number of exemplary methods for the preparation of the 20 compositions of the invention are provided below. These methods are intended to illustrate the nature of such preparations are not intended to limit the scope of applicable methods.

Generally, the reaction conditions such as temperature, reaction time, solvents, workup procedures, and the like, will be those common in the art 25 for the particular reaction to be performed. The cited reference material, together with material cited therein, contains detailed descriptions of such conditions. Typically the temperatures will be -100°C to 200°C, solvents will be aprotic or protic, and reaction times will be 10 seconds to 10 days. Workup typically consists of quenching any unreacted reagents followed by partition 30 between a water/organic layer system (extraction) and separating the layer containing the product.

Oxidation and reduction reactions are typically carried out at 35 temperatures near room temperature (about 20°C), although for metal hydride reductions frequently the temperature is reduced to 0°C to -100°C, solvents are typically aprotic for reductions and may be either protic or aprotic for oxidations. Reaction times are adjusted to achieve desired conversions.

Condensation reactions are typically carried out at temperatures near

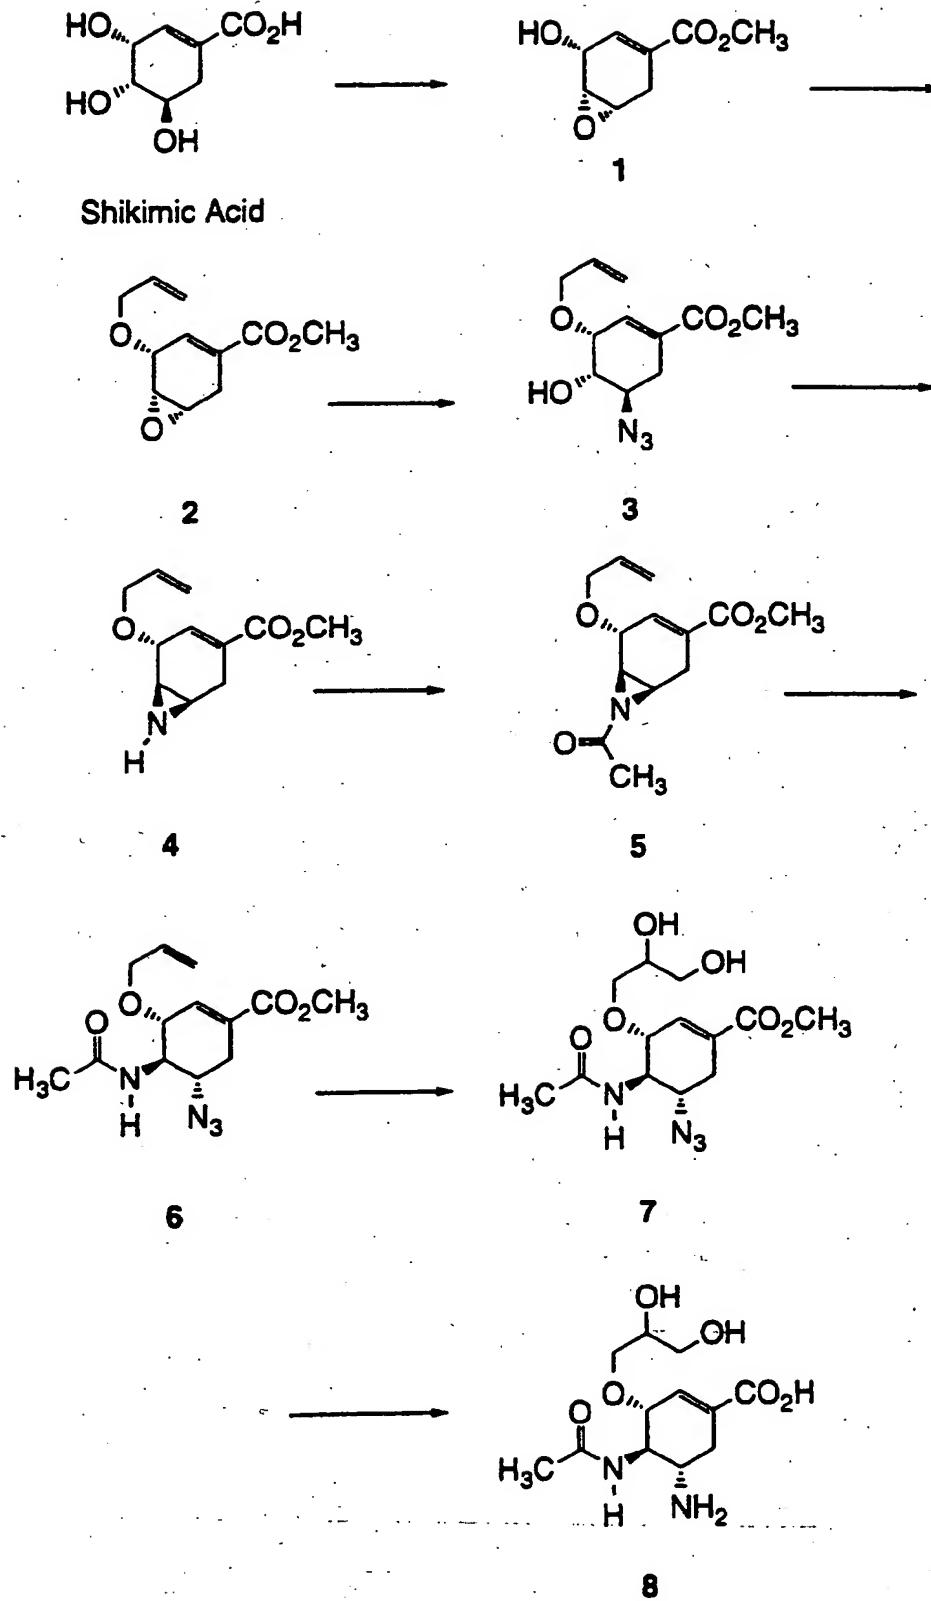

room temperature, although for non-equilibrating, kinetically controlled condensations reduced temperatures (0°C to -100°C) are also common.

Solvents can be either protic (common in equilibrating reactions) or aprotic (common in kinetically controlled reactions).

5 Standard synthetic techniques such as azeotropic removal of reaction by-products and use of anhydrous reaction conditions (e.g. inert gas environments) are common in the art and will be applied when applicable.

One exemplary method of preparing the compounds of the invention is shown in Scheme 1 below. A detailed description of the methods is found  
10 in the Experimental section below.

Aziridine 5 is converted to the amino nitrile 9 by Yb(CN)<sub>3</sub> catalyzed addition of TMSCN according to the procedure of Utimoto and co-workers, "Tetrahedron Lett.", 31:6379 (1990).

Conversion of nitrile **9** to the corresponding amidine **10** is accomplished using a standard three step sequence: i) H<sub>2</sub>S; ii) CH<sub>3</sub>I; iii) NH<sub>4</sub>OAc. A typical conversion is found in "J. Med. Chem.", 36:1811 (1993).

Nitrile 9 is converted to the amino methyl compound 11 by reduction  
15 using any of the available methods found in "Modern Synthetic Reactions"  
2nd ed. H.O. House, Benjamin/Cummings Publishing Co., 1972.

Amino methyl compound 11 is converted to the bis-Boc protected guanidino compound 12 by treating 11 with N,N'-bis-Boc-1H-pyrazole-1-carboxamidine according to the method found in "Tetrahedron Lett.", 36:299 (1995).

The aziridine 5 is opened with  $\alpha$ -cyano acetic acid t-butyl ester to give 13. Aziridine openings of this type are found in "Tetrahedron Lett.", 23:5021 (1982). Selective hydrolysis of the t-butyl ester moiety under acidic conditions followed by decarboxylation gives nitrile 14.

10 Reduction of 14 to the amino ethyl derivative 15 is accomplished in the same fashion as the conversion of 9 to 11. The amine 15 is then converted into the guanidino derivative 16 with N,N'-bis-Boc-1H-pyrazole-1-carboxamidine according to the method found in "Tetrahedron Lett.", 36:299 (1995).

15 The nitrile 14 is converted to the corresponding amidine 17 using the same sequence described above for the conversion of 9 to 10.

The epoxy alcohol 1 is protected (PG=protecting group), for example with MOMCl. Typical conditions are found in "Protective Groups in Organic Synthesis" 2nd ed., T.W. Greene and P.G.M. Wuts, John Wiley & Sons, New York, NY, 1991.

10 The epoxide 19 is opened with NaN<sub>3</sub>/NH<sub>4</sub>Cl to the amino alcohol 20 according to the procedure of Sharpless and co-workers, "J. Org. Chem.", 50:1557 (1985).

Reduction of 20 to the N-acetyl aziridine 21 is accomplished in a three step sequence: 1) MsCl/triethyl amine; 2) H<sub>2</sub>/Pd; 3) AcCl/pyridine. Such transformations can be found in "Angew. Chem. Int. Ed. Engl.", 33:599 (1994).

Aziridine 21 is converted to the azido amide 22 by opening with 5 NaN<sub>3</sub>/NH<sub>4</sub>Cl in DMF at 65 °C as described in "J. Chem. Soc. Perkin Trans I", 801 (1976).

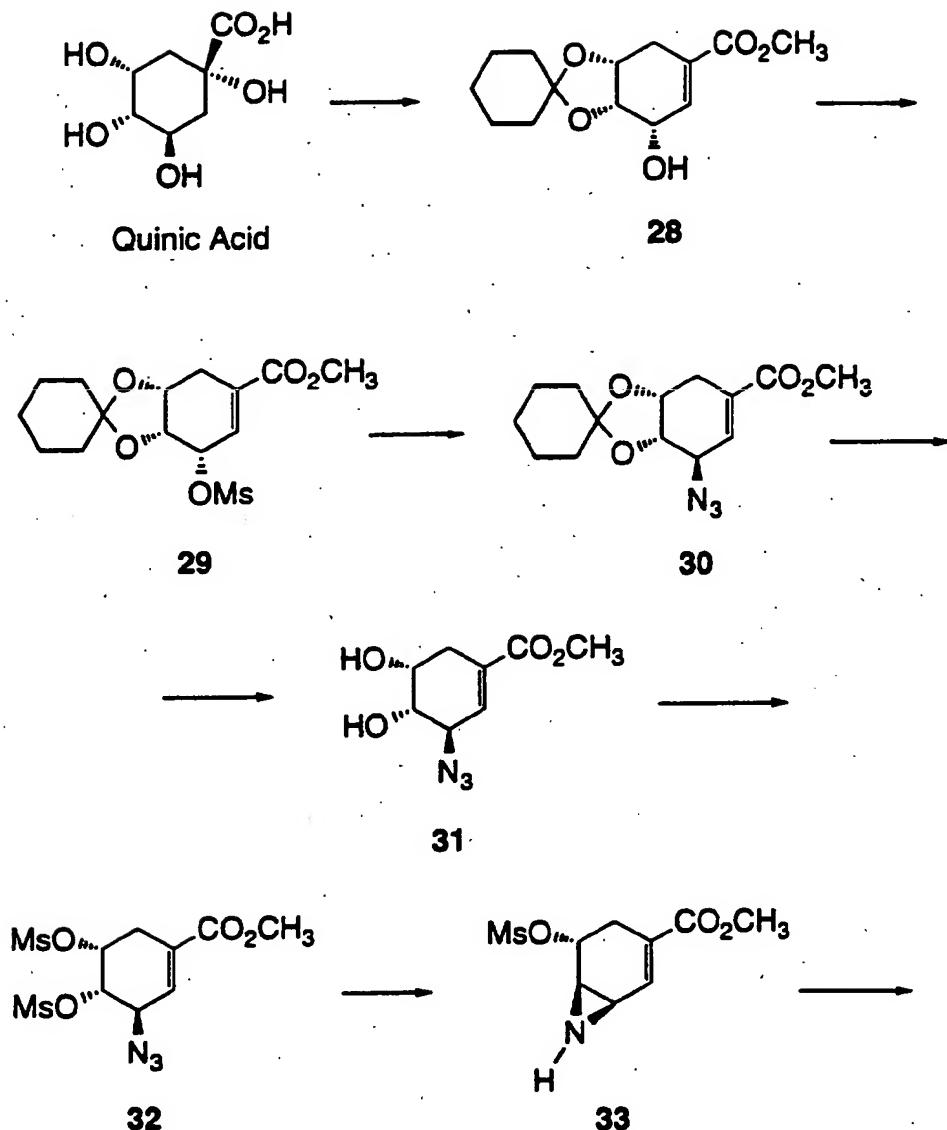

Removal of the MOM protecting group of 22 is accomplished using the methods described in "Protective Groups in Organic Synthesis" 2nd ed., T.W. Greene and P.G.M. Wuts, John Wiley & Sons, New York, NY, 1991. The 10 resulting alcohol is converted directly to aziridine 24 with TsCl in pyridine. Such transformations are found in "Angew. Chem. Int. Ed. Engl.", 33:599 (1994).

Aziridine 24 is then reacted with ROH, RNH<sub>2</sub>, RSH or an 15 organometallic (metal-R) to give the corresponding ring opened derivatives 25, 26, 27 and 27.1 respectively. Aziridine openings of this type are found in "Tetrahedron Lett.", 23:5021 (1982) and "Angew. Chem. Int. Ed. Engl.", 33:599 (1994).

Another class of compounds of the invention are prepared by the 20 method of Schemes 5a and 5b. Quinic acid is converted to 28 by the method of Shing, T.K.M.; et al., "Tetrahedron", 47(26):4571 (1991). Mesylation with MsCl in TEA/CH<sub>2</sub>Cl<sub>2</sub> will give 29 which is reacted with NaN<sub>3</sub> in DMF to give 30. Reaction of 30 with TFA in CH<sub>2</sub>Cl<sub>2</sub> will give 31 which is mesylated with MsCl 25 in TEA/CH<sub>2</sub>Cl<sub>2</sub> to give 32. Reaction with triphenylphosphine in water will give 33 which is converted to 35 by sequential application of: 1) CH<sub>3</sub>C(O)Cl in pyridine, 2) NaN<sub>3</sub> in DMF, and 3) NaH in THF. Alkylation of 35 with a wide 30 variety of nucleophiles common in the art will provide a number of compounds such as 36. Methods for elaboration of the compounds such as 36 to other embodiments of the invention will be similar to those described above.

5 Another class of compounds of the invention are prepared by the method of Scheme 6. Protected alcohol 22 (PG=methoxymethyl ether) is deprotected under standard conditions described in "Protective Groups in Organic Synthesis" 2nd ed., T.W. Greene and P.G.M. Wuts, John Wiley & Sons, New York, NY, 1991. Alcohol 51 is converted to acetate 52 with acetic anhydride and pyridine under standard conditions. Acetate 52 is treated with TMSOTf or BF<sub>3</sub>•OEt to afford oxazoline 53. Such transformations are described in "Liebigs Ann. Chem.", 129 (1991) and "Carbohydrate Research", 181 (1993), respectively. Alternatively, alcohol 51 is transformed to oxazoline 53 by conversion to the corresponding mesylate or tosylate 23 and 10 subsequently cyclized to the oxazoline under standard conditions, as described in "J. Org. Chem.", 50:1126 (1985) and "J. Chem. Soc.", 1385 (1970). Oxazoline 53 is reacted with ROH, RR'NH, or RSH (wherein R and R' are selected to be 15 consistent with the definition of W<sub>6</sub> above) provide the corresponding ring opened derivatives 54, 55, and 56 respectively. Such transformations are described in "J. Org. Chem.", 49:4889 (1984) and "Chem. Rev.", 71:483 (1971). 20

One aspect of the invention is directed to methods of making compounds of the invention comprising processes A, B, C, D, E, F, G, H, I, J, K, L, M, N, O, P, Q, R, S, T, U, V or W of Schemes 36-40.1, alone or in combination with each other. Each method embodiment of Table 27 is separated by a ":". If the embodiment is a single letter than it corresponds to one of the processes A-W. If it is more than one letter than it corresponds to each of the processes performed sequentially in the order indicated.

General aspects of these exemplary methods are described below and in the Example. Each of the products of the following processes is optionally separated, isolated, and/or purified prior to its use in subsequent processes.

The terms "treated", "treating", "treatment", and the like, mean contacting, mixing, reacting, allowing to react, bringing into contact, and other terms common in the art for indicating that one or more chemical entities is treated in such a manner as to convert it to one or more other chemical entities. This means that "treating compound one with compound two" is synonymous with "allowing compound one to react with compound two", "contacting compound one with compound two", "reacting compound one with compound two", and other expressions common in the art of organic synthesis for reasonably indicating that compound one was "treated", "reacted", "allowed to react", etc., with compound two.

"Treating" indicates the reasonable and usual manner in which organic chemicals are allowed to react. Normal concentrations (0.01M to 10M, typically 0.1M to 1M), temperatures (-100°C to 250°C, typically -78°C to 150°C, more typically -78°C to 100°C, still more typically 0°C to 100°C), reaction vessels (typically glass, plastic, metal), solvents, pressures, atmospheres (typically air for oxygen and water insensitive reactions or nitrogen or argon for oxygen or water sensitive), etc., are intended unless otherwise indicated. The knowledge of similar reactions known in the art of organic synthesis are used in selecting the conditions and apparatus for "treating" in a given process. In particular, one of ordinary skill in the art of organic synthesis selects conditions and apparatus reasonably expected to successfully carry out the chemical reactions of the described processes based on the knowledge in the art.

30 Process A. Scheme 36

Shikimic acid is used to prepare compound 270 by the following process.

The cis-4,5-diol function of shikimic acid is differentiated from the carboxylic acid at carbon 1 by selective protection of these two functionalities. Typically the cis-4,5-diol function is protected as a cyclic ketal and the carboxylic acid function is protected as an ester.

R50 is an acid labile 1,2-diol protecting group such as those described in

the above cited work of Greene, typically a cyclic ketal or acetal, more typically, a ketal of cyclohexanone or acetone. R51 is an acid stable carboxylic acid protecting group such as those described in the above cited work of Greene, typically a linear, branched or cyclic alkyl, alkenyl, or alkynyl of 1 to 12 carbon atoms such as those shown as groups 2-7, 9-10, 15, or 100-660 of Table 2, more typically a linear or branched alkyl of 1 to 8 carbon atoms such as those shown as groups 2-5, 9, or 100-358 of Table 2, still more typically a linear or branched alkyl of 1 to 6 carbon atoms such as those shown as groups 2-5, 9, or 100-141 of Table 2, more typically yet, R51 is methyl, ethyl, n-propyl, i-propyl, n-butyl, sec-butyl, i-butyl, or t-butyl.

Shikimic acid is reacted to protect the carboxylic acid with group R51 and the cis-4,5-diol with group R50. Typically shikimic acid is treated with an alcohol, such as methanol, ethanol, n-propanol, or i-propanol, and an acid catalyst, such as a mineral acid or a sulfonic acid such as methane, benzene or toluene sulfonic acid, followed by a dialkyl ketal or acetal of a ketone or aldehyde, such as 2,2-dimethoxy-propane, or 1,1-dimethoxy-cyclohexane, in the presence of the corresponding ketone or aldehyde, such as acetone or cyclohexanone. Optionally, the product of the alcohol and acid catalyst treatment is separated, isolated and/or purified prior to treatment with dialkyl ketal or acetal. Alternatively shikimic acid is treated with CH<sub>2</sub>N<sub>2</sub>.

alkanone or cycloalkanone, as described above, optionally, in the presence of  
an acid catalyst, as described above, to form compound 274. More typically,

Scheme 41

The amine 300 (an intermediate in Example 52, optionally purified prior to use) is treated with Boc anhydride to give the mono Boc protected amine 301. Such a transformation is found in Greene, T.W. "Protective Groups in Organic Synthesis" 2nd Ed. (John Wiley & Sons, New York, 1991) pages 327-328.

Methyl ester 301 is reduced to the corresponding primary allylic alcohol 302 with DIBAL at low temperature. Such a conversion is described by Garner, P. and Park, J. M., "J. Org. Chem.", 52:2361 (1987).

The primary alcohol 302 is protected as its *p*-methoxy benzyl ether derivative 303 by treatment with 4-methoxybenzyl chloride under basic conditions. Such a conversion is described in Horita, K. et. al., "Tetrahedron", 42:3021 (1986).

The MOM and Boc protecting groups of 303 are removed by treatment with TFA/CH<sub>2</sub>Cl<sub>2</sub> to give the amino alcohol 304. Such transformations are found in Greene, T.W. "Protective Groups in Organic Synthesis", 2nd. Ed. (John Wiley & Sons, New York, 1991).

Conversion of 304 into the corresponding trityl protected aziridine 305 is accomplished in a one pot reaction two step sequence: 1) TrCl/TEA, 2) MsCl/TEA. Such a transformation has been previously described.

Aziridine 305 is then converted the corresponding Boc protected derivative 307 by first removal of the trityl group with HCl/acetone to give 306. Such a transformation is described in Hanson, R. W. and Law, H. D. "J. Chem. Soc.", 7285 (1965). Aziridine 306 is then converted into the corresponding Boc derivative 307 by treatment with Boc anhydride. Such a conversion is described in Fitremann, J., et. al. "Tetrahedron Lett.", 35:1201 (1994).

The allylic aziridine 307 is opened selectively at the allylic position with a carbon nucleophile delivered via a higher order organocuprate in the presence of BF<sub>3</sub>·Et<sub>2</sub>O at low temperature to give the opened adduct 308. Such an opening is described in Hudlicky, T., et. al. "Synlett." 1125 (1995).

The Boc protected amine 308 is converted into the N-acetyl derivative 309 in a two step sequence: 1) TFA/CH<sub>2</sub>Cl<sub>2</sub>; 2) Ac<sub>2</sub>O/pyridine. Such transformations can be found in Greene, T.W., "Protective Groups in Organic Synthesis", 2nd. Ed. (John Wiley & Sons, New York, 1991) pages 327-328 and pages 351-352.

Benzyl ether 309 is deprotected with DDQ at room temperature to give

the primary allylic alcohol 310. Such a transformation is found in Horita, K., et. al. "Tetrahedron" 42:3021 (1986).

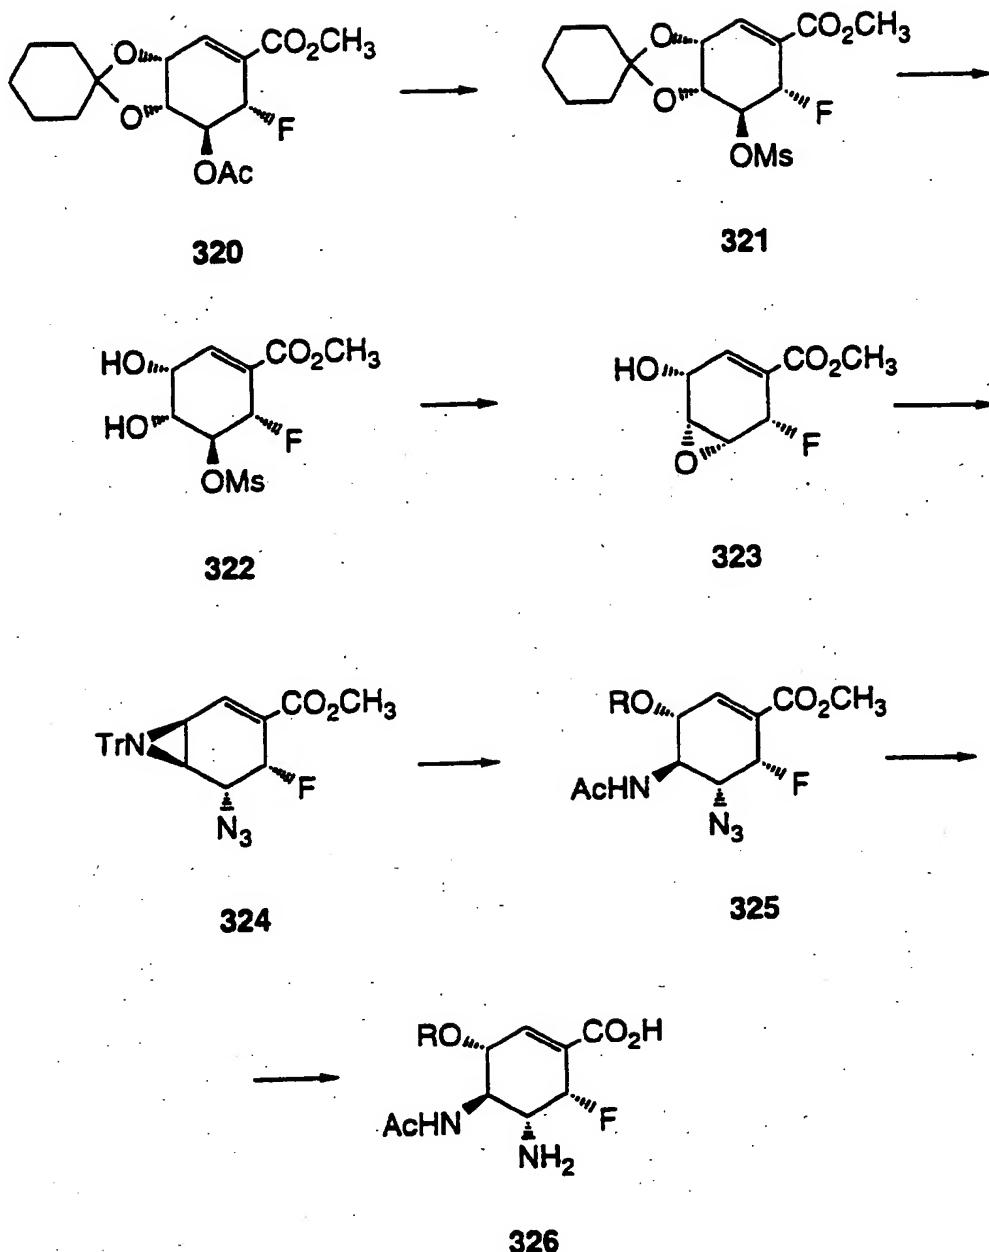

Alcohol 310 is oxidized and converted in a one pot reaction into the methyl ester 311 via a Corey oxidation using MnO<sub>2</sub>/AcOH/MeOH/NaCN.

- 5 Such a transformation can be found in Corey, E. J., et. al. "J. Am. Chem. Soc.", 90:5616 (1968).

Azido ester 311 is converted into amino acid 312 in a two step sequence 1) Ph<sub>3</sub>P/H<sub>2</sub>O/THF; 2) KOH/THF. Such a conversion has been described previously.

Scheme 42

The known fluoro acetate 320 (Sutherland, J. K., et.al. "J. Chem. Soc. Chem. Commun." 464 (1993) is deprotected to the free alcohol and then converted into the corresponding mesylate 321 in two steps: 1) NaOMe; 2) MsCl/TEA. Such transformations are described in Greene, T.W., "Protective Groups in Organic Synthesis", 2nd. Ed. (John Wiley & Sons, New York, 1991).

Deprotection of 321 under acidic conditions gives diol 322 which is cyclized to the epoxy alcohol 323 under basic conditions. Such a conversion has been previously described.

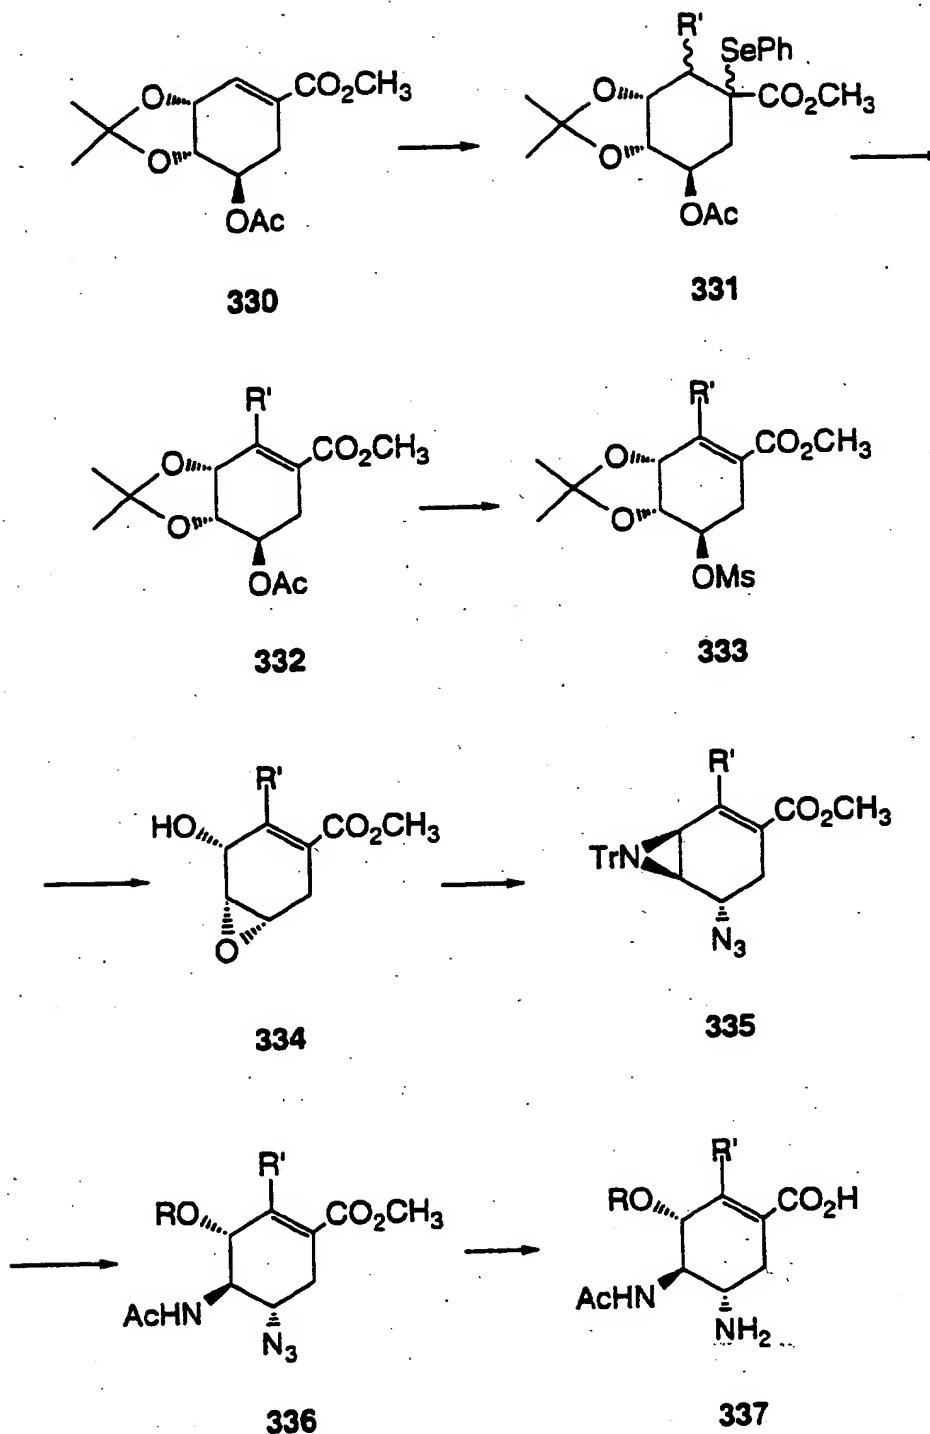

Conversion of 323 to the N-trityl protected aziridine 324 is accomplished with the following sequence: 1) MOMCl/TEA; 2) NaN<sub>3</sub>/NH<sub>4</sub>Cl; 3) MsCl/TEA; 4) PPh<sub>3</sub>/TEA/H<sub>2</sub>O; 5) NaN<sub>3</sub>/NH<sub>4</sub>Cl; 6) HCl/MeOH; 7) i)TrCl, ii) MsCl/TEA. Such a sequence has been previously described.

The aziridine 324 is then opened with the appropriate alcohol under Lewis acid conditions and then treated with Ac<sub>2</sub>O/pyridine to give the acetylated product 325. Such a transformation has been previously described.

The ester 325 is converted to the corresponding amino acid 326 in a two step sequence: 1) PPh<sub>3</sub>/H<sub>2</sub>O/THF; 2) KOH/THF. Such a transformation has been previously described.

United States Patent No. 5,214,165, and in particular, the "Descriptions and Examples" at column 9, line 61 to column 18, line 26, describes the preparation of 6 $\alpha$  and 6 $\beta$  fluoro Shikimic acid. These fluoro compounds are suitable starting materials for methods of making compounds of the invention that use Shikimic acid.

Scheme 43

Unsaturated ester 330 (obtainable by standard acetylation methods from the acetonide alcohol described in Campbell, M. M., et. al., "Synthesis", 5 179 (1993)) is reacted with the appropriate organocuprate where R' is the ligand to be transferred from the organocuprate. The resultant intermediate is then trapped with PhSeCl to give 331 which is then treated with 30% H<sub>2</sub>O<sub>2</sub> to give the  $\alpha,\beta$ -unsaturated ester 332. Such a transformation can be found in Hayashi, Y., et. al, "J. Org. Chem." 47:3428 (1982).

10 Acetate 332 is then converted into the corresponding mesylate 333 in a two step sequence: 1) NaOMe/MeOH; 2) MsCl/TEA. Such a transformation has been previously described and can also be found in Greene, T.W., "Protective Groups in Organic Synthesis", 2nd. Ed. (John Wiley & Sons, New York, 1991).

15 The acetonide 333 is then converted into the epoxy alcohol 334 in a two step sequence: 1) p-TsOH/MeOH/ $\Delta$ ; 2) DBU/THF. Such a transformation has been previously described.

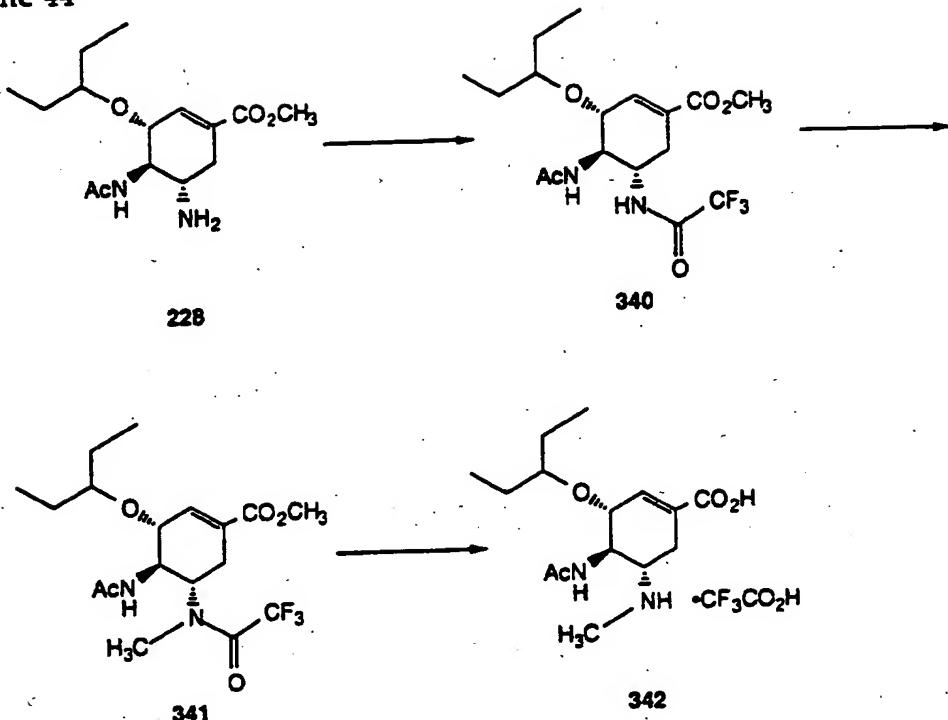

20 Conversion of epoxide 334 into N-trityl aziridine 335 is accomplished by the following sequence: 1) MOMCl/TEA; 2) NaN<sub>3</sub>/NH<sub>4</sub>Cl; 3) MsCl/TEA; 4) PPh<sub>3</sub>/TEA/H<sub>2</sub>O; 5) NaN<sub>3</sub>/NH<sub>4</sub>Cl; 6) HCl/MeOH; 7) i)TrCl, ii) MsCl/TEA. Such a sequence has been previously described.

The aziridine 335 is then opened with the appropriate alcohol under Lewis acid conditions and then treated with Ac<sub>2</sub>O/pyridine to give the acetylated product 336. Such a transformation has been previously described.

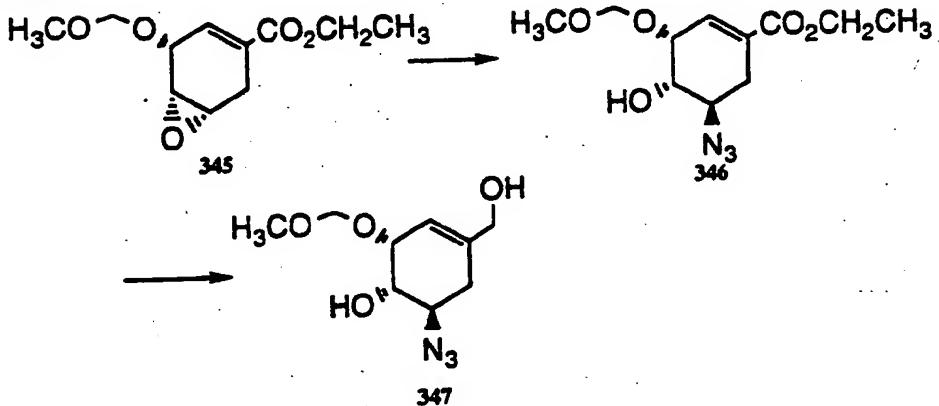

25 The azido ester 336 is converted to the corresponding amino acid 337 in a two step sequence: 1) PPh<sub>3</sub>/H<sub>2</sub>O/THF; 2) KOH/THF. Such a transformation has been previously described.

Schemes 44 and 45 are referred to in the examples.

Modification of the exemplary starting materials to form different E<sub>1</sub> groups has been described in detail and will not be elaborated here. See Fleet, G.W.J. et al.; "J. Chem. Soc. Perkin Trans. I", 905-908 (1984), Fleet, G.W.J. et al.; "J. Chem. Soc., Chem. Commun.", 849-850 (1983), Yee, Ying K. et al.; "J. Med. Chem.", 33:2437-2451 (1990); Olson, R.E. et al.; "Bioorganic & Medicinal Chemistry Letters", 4(18):2229-2234 (1994); Santella, J.B. III et al.; "Bioorganic & Medicinal Chemistry Letters", 4(18):2235-2240 (1994); Judd, D.B. et al.; "J. Med. Chem.", 37:3108-3120 (1994) and Lombaert, S. De et al.; "Bioorganic & Medicinal Chemistry Letters", 5(2):151-154 (1994).

The E<sub>1</sub> sulfur analogs of the carboxylic acid compounds of the invention are prepared by any of the standard techniques. By way of example and not limitation, the carboxylic acids are reduced to the alcohols by standard methods. The alcohols are converted to halides or sulfonic acid esters by 5 standard methods and the resulting compounds are reacted with NaSH to produce the sulfide product. Such reactions are described in Patai, "The Chemistry of the Thiol Group" (John Wiley, New York, 1974), pt. 2, and in particular pages 721-735.

Modifications of each of the above schemes leads to various analogs of 10 the specific exemplary materials produced above. The above cited citations describing suitable methods of organic synthesis are applicable to such modifications.

In each of the above exemplary schemes it may be advantageous to 15 separate reaction products from one another and/or from starting materials. The desired products of each step or series of steps is separated and/or purified (hereinafter separated) to the desired degree of homogeneity by the techniques common in the art. Typically such separations involve multiphase extraction, crystallization from a solvent or solvent mixture, distillation, sublimation, or chromatography. Chromatography can involve any number 20 of methods including, for example, size exclusion or ion exchange chromatography, high, medium, or low pressure liquid chromatography, small scale and preparative thin or thick layer chromatography, as well as techniques of small scale thin layer and flash chromatography.

Another class of separation methods involves treatment of a mixture 25 with a reagent selected to bind to or render otherwise separable a desired product, unreacted starting material, reaction by product, or the like. Such reagents include adsorbents or absorbents such as activated carbon, molecular sieves, ion exchange media, or the like. Alternatively, the reagents can be acids in the case of a basic material, bases in the case of an acidic material, 30 binding reagents such as antibodies, binding proteins, selective chelators such as crown ethers, liquid/liquid ion extraction reagents (LIX), or the like.

Selection of appropriate methods of separation depends on the nature 35 of the materials involved. For example, boiling point, and molecular weight in distillation and sublimation, presence or absence of polar functional groups in chromatography, stability of materials in acidic and basic media in multiphase extraction, and the like. One skilled in the art will apply techniques most likely to achieve the desired separation.

All literature and patent citations above are hereby expressly incorporated by reference at the locations of their citation. Specifically cited sections or pages of the above cited works are incorporated by reference with specificity. The invention has been described in detail sufficient to allow one of ordinary skill in the art to make and use the subject matter of the following claims. It is apparent that certain modifications of the methods and compositions of the following claims can be made within the scope and spirit of the invention.

### Examples

#### General

The following Examples refer to the Schemes.

Some Examples have been performed multiple times. In repeated Examples, reaction conditions such as time, temperature, concentration and the like, and yields were within normal experimental ranges. In repeated Examples where significant modifications were made, these have been noted where the results varied significantly from those described. In Examples where different starting materials were used, these are noted. When the repeated Examples refer to a "corresponding" analog of a compound, such as a "corresponding ethyl ester", this intends that an otherwise present group, in this case typically a methyl ester, is taken to be the same group modified as indicated. For example, the "corresponding ethyl ester of compound 1" is

The ear probe attachment was used, the probe placed on the thigh of the animal, with the slow instrument mode selected. Readings were made after a 30 second stabilization time on each animal. Use of this device for  
 25 measuring effects of influenza virus on arterial oxygen saturation has been described by Sidwell et al., *Antimicrob. Agents Chemother.* 36:473-476 (1992).

*Experiment Design for Oral Administration Study:* Groups of eleven mice infected intranasally with an approximate 95% lethal dose of virus received each dose of test compound. Doses of both 203 and GG167 were 50, 10, 2 and 0.5 mg/kg/day. Treatments were i.p. twice daily for 5 days beginning 5 4 hr pre-virus exposure. Eight of the infected, treated mice at each dosage and 16 infected, saline-treated controls were assayed for SaO<sub>2</sub> level on days 3 through 10; deaths were recorded daily in these animals for 21 days. The remaining three animals in each group as well as six saline-treated control mice were killed on day 6 and their lungs removed, weighed, assigned a 10 consolidation score based on extent of plum color in the lungs (0=normal, 4=100% of lung affected). Since no toxicity had been seen at a dose of 300 mg/kg/day of 203 and literature reports indicate GG167 to be similarly nontoxic, toxicity controls were not included in this study.

*Experiment Design for Intraperitoneal Administration Study:* Groups 15 of 11 mice were infected intranasally with an approximate 95% lethal dose of virus and treated with 250, 50, or 10 mg/kg/day of 203 or GG167 or with 100, 32 or 10 mg/kg/day of ribavirin. Treatment was by oral gavage (p. o.) twice daily for 5 days beginning 4 hr pre-virus exposure. Eight of the animals in each group were held for 21 days, with deaths noted daily and SaO<sub>2</sub> levels 20 determined on days 3-10. The remaining 3 infected mice in each group were killed on day 6 and their lungs removed, weighed, assigned a consolidation score of 0 (normal) to 4 (100% lung affected). Fifteen infected mice were treated with saline only and held 21 days with SaO<sub>2</sub> determined as above, and 6 additional infected, saline treated mice were killed on day 6 for lung assay. 25 Three normal controls were held 21 days, with SaO<sub>2</sub> determined in parallel with the above, and an additional 3 normal animals were killed on day 6 for lung weight and score.

*Experiment Design for Low Dose Oral Administration Study:* Groups 30 of 8 mice infected intranasally with an approximate 90% lethal concentration of virus received each dosage of compound. Doses of each compound were 10, 1, and 0.1 mg/kg/day. Treatments were p.o. twice daily for 5 days beginning 4 hr pre-virus exposure. Eight of the infected, treated mice at each dosage and 16 infected, saline-treated controls were assayed for SaO<sub>2</sub> level on days 3 through 11; deaths were recorded daily in these animals for 21 days.

35 *Statistical Evaluation:* Increase in survivor number was evaluated by chi square analysis with Yates' correction. Mean survival time increases and differences in SaO<sub>2</sub>, lung weight and lung virus titers were analyzed by t-test.

Lung score differences were evaluated by ranked sum analysis. In all cases, differences between drug-treated and saline-treated controls were studied.

The results of the i.p. dosing experiment are summarized in Table I and in Figures 1 and 2. While in this model both compounds were significantly inhibitory at the high dose used, 203 treatment also resulted in significant survivors at a dose of 10 mg/kg/day. SaO<sub>2</sub> decline was particularly inhibited by both compounds at the 50 mg/kg/day dose, and again GG167 appeared to also prevent this decline at 10 and even 2 mg/kg/day. The lung score data appear to show the same trend of GG167 being effective at more than one dose. Some erraticism was seen in lung weights, with lungs taken from the mice receiving the highest dose of GG167 having a greater mean weight than the saline-treated controls.

The p.o. dosing study is summarized in Table II, with daily SaO<sub>2</sub> values shown in Figures 3-5. Oral treatment with all three drugs in this model was significantly inhibitory to the influenza virus infection, preventing death, lowering lung scores and infection-associated lung weights, and inhibiting the usual decline in SaO<sub>2</sub>.

The p.o. low dose study results are summarized in Table III and in Figures 6-8. In this experiment, the infection was lethal to 14 of 16 saline-treated animals, the mean survival time being 9.6 days in this group. While all three compounds exhibited some degree of inhibitory effect on the virus infection, 262 (the ethyl ester prodrug) was the most effective at every dose as evidenced by number of survivors, mean survival time, and prevention of SaO<sub>2</sub> decline.

Table III shows the mean SaO<sub>2</sub>% for all assay time taken together. The daily values for each compound are graphically represented in Figures 6 through 8. Figure 6 illustrates the SaO<sub>2</sub> data with the highest concentrations of each compound; Figure 7 shows the values at the median dose of each compound, and the SaO<sub>2</sub> values for the low dose of each compound are compared in Figure 8.

Table III and Figs. 6-8 indicate that while all three compounds were active orally against an experimentally induced influenza A (H1N1) virus infection, 262 was considered most effective. It was not determined whether the improved antiviral potency of 262 was unaccompanied with a concomitant increased animal toxicity, but this is unlikely since its greater efficacy is expected to be a result of its elevated oral bioavailability.

Surprisingly, the foregoing demonstrates that in this model the oral or i.p. administration of GG167 was effective in practical therapeutic doses at reducing mortality in influenza-infected mice, despite the conclusion of Ryan et al. (*Antimicrob. Agents Chemother.*, 38(10):2270-2275) [1994]) that "it is likely that the relatively poor in vivo activity seen with GG167 in mice following intraperitoneal administration, despite good bioavailability, is due to its rapid clearance from the plasma, permitting poor penetration into respiratory secretions, coupled with its inability to penetrate and persist inside cells....Similarly, the poor efficacy following oral dosing is probably a consequence of poor oral bioavailability in addition to these other factors." (p.2274). These observations are consistent with Von Izstein et al., WO 40 91/16320, WO 92/06691 and U.S. patent 5,360,817, which cover or are directed specifically to GG167. These patent documents are devoid of any teaching or

suggestion to administer GG167 by any other route than intranasal. However, intranasal administration is believed to be inconvenient and costly in some circumstances. It would be advantageous if more facile routes of administration could be employed for GG167 and its related compounds set forth in WO 91/16320, WO 92/06691 and U.S. patent 5,360,817.

Thus, an embodiment of this invention is a method for the treatment or prophylaxis of influenza virus infection in a host comprising administering to the host, by a route other than topically to the respiratory system, a therapeutically effective dose of an antivirally active compound having formula (X) or (Y)

(x)

(y)

where in general formula (x), A is oxygen, carbon or sulphur, and in general formula (y), A is nitrogen or carbon;

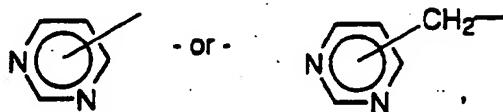

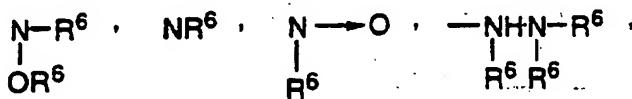

R<sup>1</sup> denotes COOH, P(O)(OH)<sub>2</sub>, NO<sub>2</sub>, SOOH, SO<sub>3</sub>H, tetrazol, CH<sub>2</sub>CHO, CHO or CH(CHO)<sub>2</sub>,

R<sup>2</sup> denotes H, OR<sup>6</sup>, F, Cl, Br, CN, NHR<sup>6</sup>, SR<sup>6</sup>, or CH<sub>2</sub>X, wherein X is NHR<sup>6</sup>, halogen or OR<sup>6</sup> and

R<sup>6</sup> is hydrogen; an acyl group having 1 to 4 carbon atoms; a linear or cyclic alkyl group having 1 to 6 carbon atoms, or a halogen-substituted analogue thereof; an allyl group or an unsubstituted aryl group or an aryl substituted by a halogen, an OH group, an NO<sub>2</sub> group, an NH<sub>2</sub> group or a COOH group,

R<sup>3</sup> and R<sup>3'</sup> are the same or different, and each denotes hydrogen, CN, NHR<sup>6</sup>, N<sub>3</sub>, SR<sup>6</sup>, =N-OR<sup>6</sup>, OR<sup>6</sup>, guanidino,

25

R<sup>4</sup> denotes NHR<sup>6</sup>, SR<sup>6</sup>, OR<sup>6</sup>, COOR<sup>6</sup>, NO<sub>2</sub>, C(R<sup>6</sup>)<sub>3</sub>, CH<sub>2</sub>COOR<sup>6</sup>, CH<sub>2</sub>NO<sub>2</sub> or CH<sub>2</sub>NHR<sup>6</sup>, and

R<sup>5</sup> denotes CH<sub>2</sub>YR<sup>6</sup>, CHYR<sup>6</sup>CH<sub>2</sub>YR<sup>6</sup> or CHYR<sup>6</sup>CHYR<sup>6</sup>CH<sub>2</sub>YR<sup>6</sup>, where Y is O, S, NH or H, and successive Y moieties in an R<sup>5</sup> group are the same or different,

and pharmaceutically acceptable salts or derivatives thereof,

5 provided that in general formula (x)

(i) when R<sup>3</sup> or R<sup>3'</sup> is OR<sup>6</sup> or hydrogen, and A is oxygen or sulphur, then said compound cannot have both

(a) an R<sup>2</sup> that is hydrogen and

(b) an R<sup>4</sup> that is NH-acyl, and

10 (ii) R<sup>6</sup> represents a covalent bond when Y is hydrogen, and that in general formula (y),

(i) when R<sup>3</sup> or R<sup>3'</sup> is OR<sup>6</sup> or hydrogen, and A is nitrogen, then said compound cannot have both

(a) an R<sup>2</sup> that is hydrogen, and

(b) an R<sup>4</sup> that is NH-acyl, and

(ii) R<sup>6</sup> represents a covalent bond when Y is hydrogen.

The compounds of formulas x and y are more fully described in WO 91/16320, at page 3, line 23 to page 7, line 1, WO 92/06691 and U.S. patent 20 5,360,817, x and y are described therein as "T" and "Ia", respectively.

For the purposes herein, administration by a route "other than topically to the respiratory tract means" does not exclude administration of compound by buccal or sublingual routes, and does not exclude incidental adsorption of compound in the esophagus during oral, buccal or sublingual administration, provided however, that such as buccal, oral, sublingual or esophageal adsorption is not incidental to administration to the lungs or nasal passages by inhalers or the like. Usually, compound is administered as a formed article, a slurry or a solution.

In typical embodiments of this invention, the compound is GG167, the host is an animal other than mice (such as ferrets or humans), the route of administration is oral, and the objective of treatment and prophylaxis is reduction in mortality. Optionally, a prodrug of the compound of formula (X) or (Y) is employed, although as shown above it is not necessary to do so to achieve antiviral effect by oral administration. As prodrugs of GG167 and its co-disclosed compounds, any of the esters, amides or other prodrugs described elsewhere herein for the compounds of this invention are suitable for use with the analogous groups of the compounds of formula (X) and (Y), e.g.,

carboxyl esters or amides.

The therapeutically effective dose of GG167 and its related compounds, when administered by oral or other non-nasal administration routes, will be determined by the ordinarily skilled clinician in light of the considerations set forth in connection with dosing the compounds of this invention. For the most part the principal considerations are the route of administration and the host species. In general, larger doses will be required as one proceeds from intravenous to subcutaneous to oral administration routes, and in accord with conventional pharmacologic scaling principles as one proceeds to larger animals. Determination of therapeutically active doses is well within the ordinary skill in the art, but in general the doses will be substantially the same as those employed for the compounds of this invention.

**Trifluoroacetamide 340:** To a solution of amine 228 (100 mg, 0.34 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (3.5 mL) at 0 °C was added pyridine (41 µL, 0.51 mmol) and trifluoroacetic anhydride (TFAA) (52 µL, 0.37 mmol) and the solution was stirred for 45 min at which time additional TFAA (0.5 eq) was added. After 15 min the reaction was evaporated under reduced pressure and the residue was partitioned between ethyl acetate and 1M HCl. The organic phase was washed with saturated NaHCO<sub>3</sub>, saturated NaCl, and was dried (MgSO<sub>4</sub>), filtered, and evaporated. The residue was chromatographed on silica gel (2/1-hexane/ethyl acetate) to afford trifluoroacetamide 340 (105 mg, 78%): <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 8.64 (d, 1H, J = 7.7), 6.81 (s, 1H), 6.48 (d, 1H, J = 8.2), 4.25-4.07 (m, 3H), 3.75 (s, 3H), 3.37 (m, 1H), 2.76 (dd, 1H, J = 4.5, 18.7), 2.54 (m, 1H), 1.93 (s, 3H), 1.48 (m, 4H), 0.86 (m, 6H).

**Example 124**

**30 N-Methyl trifluoroacetamide 341:** To a solution of trifluoroacetamide 340 (90 mg, 0.23 mmol) in DMF (2 mL) at 0 °C was added sodium hydride (10 mg,

Acetic acid (28 µL) was added and the solution was evaporated. The residue was partitioned between ethyl acetate and water. The organic phase was washed with saturated NaCl, dried (MgSO<sub>4</sub>), filtered, and evaporated. The residue was chromatographed on silica gel (1/1-hexane/ethyl acetate) to afford N-methyl trifluoroacetamide 341 (81 mg, 87%) as a colorless glass: <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 6.80 (s, 1H), 6.26 (d, 1H, J = 9.9), 4.67 (m, 1H), 4.32 (m, 1H), 4.11 (m, 1H), 3.78 (s, 3H), 3.32 (m, 1H), 3.07 (br s, 3H), 2.60 (m, 2H), 1.91 (s, 3H), 1.48 (m, 4H), 0.87 (m, 6H).

**Example 125**

**N-Methyl amine 342:** To a solution of N-methyl trifluoroacetamide 341 (81 mg, 0.20 mmol) in THF (3 mL) was added 1.04 N KOH (480 µL, 0.50 mmol) and the mixture was stirred at room temperature for 14 h. The reaction was acidified with IR 120 ion exchange resin to pH~4. The resin was filtered, washed with THF, and the filtrate was evaporated. The residue was dissolved in 10% TFA/water (5 mL) and was evaporated. The residue was passed through a column (1.5X2.5 cm) of C-18 reverse phase silica gel eluting with water. # INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US 96/02882

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 115-120 are directed to a method of treatment of (diagnostic method practised on) the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2.  Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:  
  
Please see attached sheet ./.  
Claims 1-117, 121 - 123 have bee searched incompletley.
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searches without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- The additional search fees were accompanied by the applicant's protest  
 No protest accompanied the payment of additional search fees.

# INTERNATIONAL SEARCH REPORT

International Application No. PCT/US96/02882

FURTHER INFORMATION CONTINUED FROM PCTISA/

The generic formulae I and II contain almost no fixed structural moiety. In addition, the large number of values for most of the variables, in conjunction with their cascading meanings and the numerous provisos attached to their definition, renders the scope of the invention for which protection is sought ill-defined and obscure. Consequently, a complete search is precluded for practical and economic reasons.

The search was based upon though not limited to examples given in the description.
